Le Foll, Elen. to appear/October 2024. *Textbook English: A Multi-Dimensional Approach* [[Studies in Corpus Linguistics](#)]. Amsterdam: John Benjamins.

The book is based on revised versions of selected (sub)chapters from my PhD thesis:

Le Foll, Elen. 2022. *Textbook English: A Corpus-Based Analysis of the Language of EFL textbooks used in Secondary Schools in France, Germany and Spain*. Osnabrück, Germany: Osnabrück University. PhD thesis. <https://doi.org/10.48693/278>.

1 Introduction

Asked “Where is Brian?”, French nationals of a certain generation will immediately reply: “Brian is in the kitchen”. Those with a particularly good memory may follow up with: “Where is Jenny, the sister of Brian?” – and, to those in the know, the correct answer is: “Jenny is in the bathroom”.¹ There is hardly any need for an in-depth linguistic analysis to conclude that this interaction is highly unlikely to have ever taken place in a real English-speaking family home. To most teachers and learners, it will be evident that it is the result of a none too inspired attempt to model WH-question forms in a textbook dialogue aimed at beginner learners of English as a Foreign Language (EFL). Together with dull gap-fill exercises and photos of out-of-date technology, for many adults, the very mention of the word textbook evokes vivid memories of such artificially sounding, contrived and sometimes even nonsensical dialogues.

This raises the question of the status and nature of textbook language as a specific ‘variety’ of language, which is at the heart of the present study. It focuses on contemporary EFL textbooks in use in European secondary schools. Situated at the interface between linguistics and foreign language teaching, this study examines the linguistic content of these textbooks and seeks empirical answers to the questions: What kind of English do school EFL textbooks portray? And how far removed is this variety of English from the kind of English that learners can be expected to encounter outside the EFL classroom?

1.1 Research objectives and methodological approach

The above questions are critical because, as many adults’ lingering memories of school foreign language lessons testify (see also, e.g., Freudenstein 2002: 55), textbooks play an absolutely central role in classroom-based foreign language learning. In the following, we will see that the dominance of textbooks in EFL school contexts persists to this day. According to Thornbury (in response de Chong 2012: n.p.), they “(more often [than] not) instantiate the curriculum, provide the texts, and - to a large extent - guide the methodology”. In lower secondary EFL instructional contexts, in particular, textbooks constitute a major vector of foreign language input. Yet, numerous studies have shown that “considerable mismatches between naturally

¹Dialogue from *Speak English 6^e série verte* (Benhamou & Dominique 1977: 167). It was made popular by stand-up comedian Gad Elmaleh. More information on the context of this textbook dialogue can be found [here](#). An extract of the comedy sketch by Gad Elmaleh that popularised the dialogue can be viewed here with English subtitles: <https://youtu.be/11jG7lkwDwU?t=50>.

occurring English and the English that is put forward as a model in pedagogical descriptions” (Römer 2006: 125–126) exist. These mismatches have been observed and sometimes extensively described in textbooks’ representations of numerous language features ranging from the use of individual words and phraseological patterns (e.g., Conrad 2004 on the preposition *though*; Gouverneur 2008 on the high-frequency verbs *make* and *take*), to tenses and aspects (Barbieri & Eckhardt 2007 on reported speech; Römer 2005 on the progressive). More rarely, textbook language studies have also ventured into the study of spoken grammar (e.g., Gilmore 2004) and pragmatics (e.g., Hyland 1994 on hedging in ESP/EAP textbooks).

However, as we will see in Chapter 2, previous EFL textbook studies have tended to focus on one or at most a handful of individual linguistic features. Taken together, they provide valuable insights into “the kind of synthetic English” (Römer 2004a: 185) that pupils are exposed to via their textbooks; yet, what is missing is a more comprehensive, broader understanding of what constitutes ‘Textbook English’ from a linguistic point of view. Although corpus-based² textbook analysis can be traced back to the pioneering work of Dieter Mindt in the 1980s, the language of secondary school EFL textbooks (as opposed to that of general adult EFL or English for Specific Purposes [ESP] coursebooks) remains an understudied area.

The present study therefore sets out to describe the linguistic content of secondary school EFL textbooks and to survey the similarities and most striking differences between ‘Textbook English’ and ‘naturally occurring English’ as used outside the EFL classroom, with respect to a wide range of lexico-grammatical features.

To this end, a corpus of nine series of secondary school EFL textbooks (43 textbook volumes) used at lower secondary level in France, Germany, and Spain was compiled (see 4.3.1). In addition, three reference corpora are used as baselines for comparisons between the language input EFL learners are confronted with via their school textbooks and the kind of naturally occurring English that they can be expected to encounter, engage with, and produce themselves on leaving school. Two of these have been built specifically for this project with the aim of representing comparable ‘authentic’ (for a discussion of this controversial term in ELT, see 2.2) and age-appropriate learner target language.

A bottom-up, corpus-based approach is adopted (e.g., Biber & Quirk 2012; Biber & Gray 2015; Mindt 1992; 1995; Carter & McCarthy 2006). A broad range of linguistic features are considered: ranging from tenses and aspects to negation and discourse markers. We will pay particular attention to the lexico-grammatical aspects of Textbook English that substantially diverge from the target learner language reference corpora and examine these with direct comparisons of textbook excerpts with comparable texts from the reference data.

²Here the adjectives ‘corpus-based’ and ‘corpus-driven’ are used synonymously (see, e.g., Meunier & Reppen 2015: 499 for further information as to how these terms are sometimes distinguished).

1.2 Outline of the book

The following chapter outlines the background to and motivation behind the present study. Chapter 3 then provides a literature review of state-of-the-art research on the language of school EFL textbooks. It is divided in two parts. Part 1 is a methodological review in which the various methods employed so far to analyse, describe, and evaluate Textbook English are explained and illustrated with selected studies. Part 2 summarises the results of existing studies on various aspects of Textbook English, including lexical, grammatical and pragmatic aspects. Based on the methodological limitations and the gaps identified in the existing literature, Chapter 4 elaborates the specific research questions addressed in the present study. These research questions informed the decision-making processes involved in the compilation of the Textbook English Corpus (TEC) and the selection/compilation of three reference corpora designed to represent learners' target language. These processes and their motivations are explained in the remaining sections of Chapter 4.

Chapter 5 describes the multivariable statistical methods applied to describe the linguistic nature of Textbook English on multiple dimensions of linguistic variation. It begins by explaining the well-established multi-feature/dimensional analysis (MDA) method pioneered by Biber (1988; 1995; see also Berber Sardinha & Veirano Pinto 2014; 2019), before outlining the reasoning for the modified MDA framework applied in the present study. Chapter 6 presents the results of an MDA model of Textbook English which highlights the sources of linguistic variation within EFL textbooks across several dimensions of intra-textbook linguistic variation. Chapter 7 presents the results of a second MDA model that shows how Textbook English is both, in some respects, similar to and, in others, different from the kind of English that EFL learners are likely to encounter outside the classroom.

Chapter 8 explains how the two models contribute to a new understanding of the linguistic characteristics of Textbook English. This, in turn, has implications for teachers, textbook authors, editors, publishers, and policy-makers. These implications are discussed in Chapter 9. It first considers the potential impact of the substantial gaps between Textbook English and the target reference corpora before making suggestions as to how teachers, textbook authors, and editors may want to improve or supplement unnatural-sounding pedagogical texts using corpora and corpus tools. Chapter 10 focuses on the study's methodological strengths and limitations. It explains how the modified MDA framework presented and applied in this study may be of interest to corpus linguists working on a broad range of research questions. Chapter 11 concludes with a synthesis of the most important take-aways from the study. It also points to promising future research avenues.

2 Open Science statement

Among the wealth of Textbook English publications summarised in Chapter 3 (see also [Appendix A](#)), very few have included the data and, where relevant, the code necessary to reproduce or replicate the findings that they report (thereby reflecting current sharing practices in linguistics more broadly, see Bochynska et al. 2023).¹

Although the terms are sometimes used interchangeably (see Parsons et al. 2022 for a comprehensive glossary of Open Science terminology), ‘reproducibility’ is used here to refer to the ability to obtain the same results using the researchers’ original data and code, whilst ‘replicability’² entails repeating a study and obtaining compatible results with different data analysed with either the same or different methods (Berez-Kroeker et al. 2018: 4; Porte & McManus 2018: 6–7). Not only does not sharing data and materials mean that published results are not reproducible, hereby making it difficult to assess their reliability, it also makes it very difficult to attempt to replicate the results to gain insights into the extent to which they are generalisable, e.g., across a different set of EFL textbooks used in a different educational context (see also [lefolWhyWeNeed2022?](#); McManus).

A major barrier to the reproducibility of (corpus) linguistic research is that it is often not possible for copyright or, when participants are involved, data protection reasons to make linguistic data available to the wider public. However, both research practice and the impact of our research can already be greatly improved if we publish our code or, when using GUI software, methods sections detailed enough for an independent researcher to be able to perfectly repeat the full procedure. If this is done, it is possible to conduct detailed reviews of our methodologies and replicate the effects reported in published literature using different data.

Aside from data protection and copyright restrictions, there are, of course, many more reasons why researchers may be reluctant to share their data and code (see, e.g., Al-Hoorie & Marsden; Gomes et al. 2022). It is not within the scope of this monograph to discuss these; however, it is important to acknowledge that, in many ways, such transparency makes us vulnerable. At the end of the day: to err is human. Yet, the risks involved in committing to Open Science practices are particularly tangible for researchers working on individual projects, like me, who have had no formal training in project management, programming, or versioning, and have

¹This is also true of my own earlier work on the language of EFL textbooks (Le Foll 2021a; 2022a; 2022b). More recent work conducted as part of this project, however, was published alongside with the data and code (Le Foll 2022c; 2023b; 2024).

²Confusingly, other terms are also frequently used to refer to the same or related concepts, e.g., *repeatability*, *robustness* and *generalisability* (see, e.g., Belz et al. 2021: 2–3; Parsons et al. 2022).

therefore had to learn “on the job”. Nonetheless, I am convinced that the advantages outweigh the risks. Striving for transparency helps both the researchers themselves and others reviewing the work to spot and address problems. As a result, the research community can build on both the mishaps and successes of previous research, thus improving the efficiency of research processes and ultimately contributing to advancing scientific progress.

It is with this in mind that I have decided, whenever possible, to publish the data and code necessary to reproduce the results reported in the present monograph following the FAIR principles (i.e., ensuring that research materials are Findable, Accessible, Interoperable and Reusable, see Wilkinson et al. 2016). For copyright reasons, the corpora themselves cannot be made available. However, the full, unedited tabular outputs of the tool used for automatic corpus annotation (the [MFTE Perl](#); see 5.3.2 and [Appendix C](#)) are published in the [Online Supplements](#). Together with the commented data analysis scripts also published in the Online Supplements, as well as in the associated Open Science Framework (OSF) repository, these tables allow for the computational reproduction of all of the results and plots discussed in the following chapters.

In describing the study’s methodology, maximum transparency is strived for by reporting on how each sample size was determined and on which grounds variables and data points were excluded, manipulated and/or transformed. Most of these operations were conducted in the open-source programming language and environment R (R Core Team 2022). The annotated data processing and analysis scripts have been rendered to HTML pages (viewable in the Online Supplements) thus allowing researchers to review the procedures followed without necessarily installing all the required packages and running the code themselves. Furthermore, these scripts include additional analyses, tables, and plots that were made as part of this study but which, for reasons of space, were not reported on in detail here. Whenever data, packages or other open-source scripts from other researchers were used, links to these are also provided in the [Online Supplements](#) (in addition to the corresponding references in the bibliography). To reproduce the R analyses, use the `renv::restore()` command to ensure that you are using the correct package versions (Ushey & Wickham 2023). For full reproducibility it may be necessary to use `rig` to run the code in R v. 4.3.1.

3 Synthesis

3.1 Summary

This study has provided a systematic, empirical account of the kind of English that secondary school EFL learners interact with via their textbooks as compared to the kind of English that they can be expected to encounter outside the EFL classroom. This new understanding of Textbook English is important because textbooks constitute one of the major, if not the most important, vector of English language input that EFL learners encounter in the first four to five years of their secondary education. Although it is popular knowledge that the language portrayed in EFL textbooks somehow “feels” different from how English is generally used outside the classroom, this study is the first to attempt to model the nature of these linguistic peculiarities across different registers and textbook proficiency levels by accounting for a broad range of linguistic features and their co-occurrences. Specifically, it set out to describe the language that secondary school pupils in France, Germany, and Spain are exposed to via their coursebooks and their accompanying audio and audio-visual materials.

To this end, the Textbook English Corpus (TEC) was compiled. It comprises nine series of secondary school EFL textbooks (42 textbook volumes) used at lower secondary level in France, Germany, and Spain and was manually annotated for register. Three reference corpora (Spoken BNC2014, Info Teens, and Youth Fiction) were used as baselines for comparisons between the language of the TEC and the kind of naturally occurring English that learners can be expected to encounter, engage with, and produce themselves outside the EFL classroom.

From the literature review (Chapter 3), we concluded that, to date, a multitude of studies have focused on the representations of individual linguistic features in EFL and ESL textbooks. Some of these studies were described as ‘intra-textbook analyses’ because they seek to explore and describe the language of textbooks without relying on any comparison benchmarks. By contrast, ‘comparative textbook language analyses’ draw on reference corpora or corpus-driven lists to infer what is special about the language of textbooks. In this second paradigm, we identified three recurrent issues. First, previous research has failed to consider interactions between the individual linguistic features examined. Thus, whilst some influential studies have helped us to understand how English learners can be misled by their textbooks into making unidiomatic use of specific lexico-grammatical features (e.g., Römer 2005 on the progressive aspect), we concluded that only a multivariable approach can paint the full picture as to how Textbook English – as a whole – differs from the English that language learners are likely to encounter outside the EFL classroom. Second, we saw that prior scholarship has

mostly ignored register differences between the various types of texts typically included in school foreign language textbooks. Given that school EFL textbooks frequently feature, for example, extracts from short stories, dialogues, instructions, and exercises on a single double page, we argued that a meaningful analysis of Textbook English requires a register-based approach. Third, previous quantitative corpus-based studies have usually been undertaken at the corpus level, e.g., comparing the occurrences of a linguistic feature across an entire textbook corpus with those from a reference corpus, and have therefore often failed to account for the effects of varying textbook proficiency levels or the potential idiosyncrasies of individual textbook authors, editors, or publishers. Thus, prior to the present study, much textbook language research had (often implicitly) assumed that Textbook English constitutes a homogenous variety of English with no (systematic) sources of internal variation.

This study set out to test this assumption and uncover the linguistic specificities of Textbook English. Specifically, it examined the extent to which the language of current EFL textbooks used in secondary schools in France, Germany, and Spain is representative of ‘real-world’ English as used by native/proficient English speakers in similar communicative situations. It asked whether some textbook registers are more faithfully represented than others and whether textbooks’ portrayal of different registers becomes more natural-like as the textbooks’ targeted proficiency level increases. Finally, the study also sought to identify the clusters of linguistic features that characterise Textbook English across different registers and learner proficiency levels.

To answer these research questions, Biber’s (1988; 1995) multi-feature/multi-dimensional analysis (MDA) framework was chosen as a method capable of summarising the patterns of co-occurrences of many linguistic features across different groups of texts. In a preliminary study, the texts of the TEC were compared against the dimensions of Biber’s (1988) seminal model of variation in general spoken and written registers of English (Le Foll 2021a; 2022c: chap. 6). On this basis, the present study identified a number of potential methodological issues linked to both the use of Biber’s (1988) model as a baseline and the MDA framework as it is traditionally applied. Consequently, a modified MDA framework was developed and implemented for the present study. This modified framework relies on a stringent selection of linguistic features, the normalisation of feature counts to linguistically informed baselines, the application of a computationally stable dimension reduction method (Principal Component Analysis; PCA), the use of mixed-effects linear regression modelling to tease out the potential mediating effects of various variables, and the interpretation of the results using multi-dimensional graphs that expose, rather than obscure, the full breadth of linguistic variation.

In applying the modified MDA framework, the results of the study have convincingly debunked the long-held assumption that the language of school EFL textbooks can meaningfully be considered a homogenous variety of English. Mode and register emerge as significant drivers of intra-textbook linguistic variation, making it impossible to adequately describe Textbook English without considering situationally determined, functional variation. Despite few significant differences between the language of EFL textbooks used in France, Germany, and Spain or between the nine different textbook series of the TEC, this study did uncover noteworthy

interactions between the different text registers and target proficiency levels. The clusters responsible for these interactions underwent close examination. The study also explains and illustrates the key linguistic differences that distinguish stereotypically textbook-like texts from situationally similar ‘real-world’ texts.

Corroborating the findings of previous Textbook English studies, notably Mindt (1987; 1992; 1995) and Römer (2004b; 2005), the present study identified a wide gap between conversational English as it is presented in contemporary secondary school EFL textbooks and ‘real-world’ conversation that learners can be expected to be involved in outside the EFL classroom. Whilst we are not claiming that all textbook dialogues should resemble the everyday, casual conversations of English L1 speakers (as represented, e.g., in the reference Spoken BNC2014 corpus), it is somewhat disconcerting that, across all nine textbook series of the TEC, textbooks’ representations of conversational spoken English become less authentic as learners are expected to become more proficient in English.

By contrast, and more reassuringly, as the target proficiency levels of the textbooks increased, so did the observed similarities between the informative and fiction subcorpora of the TEC and their respective reference corpora. This latter trend likely points to well-intended pedagogical progressions aimed at scaffolding the development of learners’ linguistic competences. Despite this general trend towards more authentic informative texts as the textbooks’ target proficiency level increases, the results also highlighted potentially problematic textbook texts, even at the highest proficiency levels represented in the TEC (B2). We concluded that some informative texts featured in B2 textbooks were characterised by a lack of register coherence, e.g., pairing words and phrases typical of formal, written English with others more commonly found in informal, (pseudo-)spoken registers. Although this descriptive study makes no claim as to any potential causal links between Textbook English and EFL learners’ production, we did note that a lack of register awareness is an issue that has also been observed in learner corpus research (e.g., Gilquin & Paquot 2008).

We acknowledged that not all textbook texts are designed to reflect naturally occurring English. However, when it is the aim, the results of the present study, along with the use of corpus tools, can be used to adapt or create textbook texts that better reflect the kind of English learners can expect to encounter outside the EFL classroom. The results of the present study support the adoption of a “register approach” to ELT, which entails exposing learners to lexico-grammatical patterns of use in the form of situationally contextualised, meaningful constructions and texts, as proposed by Rühlemann (2008). In terms of pedagogical implications, Section 9.4 spelt out the wide-reaching implications of such a register approach for teacher education and materials design.

Although it was originally conceived with the analysis of Textbook English in mind, it is hoped that many of the changes implemented in the modified MDA framework (see 5.3) will be of interest to corpus linguists working on a wide range of research questions and language varieties. Indeed, many of the issues raised in Chapter 5 are not by any means confined to the analysis of textbook language. For instance, the solutions proposed in 5.3.1 to overcome issues such as the comparison of texts of radically different lengths, the lack of punctuation in

transcriptions of spoken language (see 5.3.2), and the non-independence of texts/text samples from the same textbook series, web domain or novel (see 5.3.8) are relevant to many other research areas. These include the study of many e-language registers (e.g., social media posts, blogs, forums, product reviews) and texts produced by young L1 users and L2 learners of all ages and proficiency levels.

Whilst by no means claiming to be fail-safe, the publication of the full code and data used to perform the analyses presented in this study is intended to allow for the computational reproducibility of the results. Crucially, it also allows for additional, independent replications. The [Online Supplements](#) exemplify how quantitative (corpus)linguistic methods can, with relatively simple means, be made more transparent, robust, and replicable. Thus, it is hoped that this study may serve as a springboard for further methodological innovations in the multivariate analysis of linguistic data.

3.2 Future directions

The present study is descriptive and exploratory in nature. As such, it opens many avenues for future research. It has contributed some methodological innovations to the MDA framework that may be further explored and tested in future MDA studies on diverse language varieties and registers. Regarding the analysis of school EFL textbooks, it has shown how Textbook English can be examined across a broad range of linguistic features both as a variety of English in its own right, and in comparison to various target reference varieties. Future studies could apply the method to study the language of different EFL, ESL and ESP textbooks and other pedagogical materials (e.g., online e learning courses) used in different educational systems and/or at different proficiency levels.

Another avenue to be explored concerns the quality and quantity of the lexical input provided by EFL textbooks. For each textbook volume and series, the word and phraseme types can be extracted and their rates of repetition across each textbook volume and series can be calculated. The lexical input of the 42 textbook volumes and nine textbook series of the TEC could then be compared to examine the extent to which they share a common core EFL lexical syllabus. In addition, the textbooks' lexical range may be compared to corpus-based lists such as the new General Service List (Brezina & Gablasova 2015) and the PHRASE List (Martinez & Schmitt 2012). Given the TEC's register annotation, it would also be possible to compare the words and phrasemes of an individual textbook register, e.g., the Conversation subcorpus of the TEC with corpus-derived lists of the most frequent words and phrasemes in spoken English (e.g., Fankhauser-Kahmeier 2024).

The modified MDA framework could also be applied to analyses of secondary school textbooks of other languages. Indeed, it would be most interesting to compare the present multi-feature/multi-dimensional models of Textbook English with those of other “textbook

languages". Such comparisons may reveal that, cross-linguistically, some of the observed characteristics of Textbook English are in fact universal features of foreign language textbooks – representative of what we might then call: '(School) Textbook Language'.

It is important to stress that, on the basis of the present study, we can only speculate as to the impact of Textbook English in and outside the EFL classroom. As vividly put by Cook (Cook 2002: 268), [i]t may be better to teach people how to draw with idealised squares and triangles than with idiosyncratic human faces. Or it may not. The job of applied linguists is to present evidence to demonstrate the learning basis for their claims [...]. Whilst a large body of evidence from usage-based linguistic studies and related disciplines has consistently highlighted the strong connection between input exposure and L2 learners' developmental patterns (e.g., Achard & Niemeier 2004; Pérez-Paredes, Mark & O'Keeffe 2020; Tyler 2012; Tyler & Ortega 2018), it still remains unclear the extent to which "bring[ing] textbooks for teaching English as a foreign language into closer correspondence with actual English" (Mindt 1996: 247) will facilitate or hamper learners' progress. Crucially, we must remember that, as insightful as these multi-dimensional descriptions of Textbook English have been, textbooks do not exist in a vacuum. Yet surprisingly few empirical studies have looked into how textbooks – i.e., not only their language, but also their structures, tasks, and activities – mediate classroom interactions and learning outcomes (Rösler & Schart 2016: 490). In addition, much research remains to be done on how teachers and students actually use textbooks in the classroom. Empirical data on the status quo in secondary EFL classrooms is urgently needed to a) understand the real impact of textbooks and b) develop research-informed recommendations for materials designers and new pre- and in-service teacher training courses that genuinely address current problems and meet teachers' and learners' needs.

In addition to classroom-based investigations into textbook use and learning outcome, the results of the present study and follow-up corpus-based textbook language studies may be triangulated with findings from learner corpora to gain new insights into L2 learning processes. Such research could test McEnery and Kifile's (1998) hypothesis that "[w]here textbooks are included in an exploration of L2 learning, they can explain differences between NS [native speaker] and NNS [non-native speaker] usage" (as cited in Tono 2004: 52). In such endeavours, robust models of textbook language are potentially very useful because few large-scale research projects will realistically be able to investigate both the language of the textbooks that learners use and the language production of these same learners (though see Möller 2020 for such a research design in the context of Content and Language Integrated Learning). The hope is that, if the models of Textbook English elaborated in the present study are shown to be generalisable to further EFL textbooks, they may be used as a means of better understanding certain usage patterns that are more frequent in the language of instructed EFL learners than in that of naturalistic ESL learners (for first attempts in this direction, see Winter & Le Foll 2022 on EFL learners' use of if-conditionals; and Le Foll 2023a on periphrastic causative constructions).

In sum, there is still much to be learnt from "pedagogically-driven corpus-based research" (Gabrielatos 2006: 1). In this study, we have even seen how MDA can be applied to describe the

language of textbooks on multiple dimensions of variation and to point to potential pedagogical issues. These corpus-based findings highlight the need for greater consideration of register in language teaching and learning. The findings were used to point to the benefits of using freely available corpora and tools to create more meaningful, content-rich learning contexts. In other words, this study has not only demonstrated how multivariable corpus-linguistic methods can be used to analyse Textbook English, but it has also outlined ways in which corpora and corpus tools can be used to boost the representativeness of ‘real-world’ language use in school EFL textbooks. As such, this pedagogically-driven corpus-based study can be said to have “corpused” full circle.

A Literature Review Data

This table provides a tabular overview of the studies surveyed as part of this study's literature review on textbook research examining describing and/or evaluating the language of English textbooks designed for English L2 learners in various instructional settings.

It presents the results of this non-exhaustive survey of Textbook English studies published over the past four decades, summarising some of the key information on each study, including its main language focus, methodological approach, information on the textbooks investigated, and, if applicable, on any reference corpora used. Empty cells represent fields for which no information was published. The table is fully searchable and filterable. You can adjust the widths of the individual columns to best fit your screen size.

This list is intended to be a dynamic resource that will grow over time. If you would like to contribute any studies to the table, please either fork [the corresponding CSV file in the repository](#) or send me an [e-mail](#) with the corresponding details of the studies that you would like to add.

This page was last updated on 07 May 2024.

The raw data can be downloaded as a comma-separated file from [the project GitHub repository](#).

B Corpus Data

B.1 Textbook English Corpus (TEC)

A detailed tabular overview of the composition of the Textbook English Corpus (TEC) together with the full bibliographic metadata is available at doi.org/10.5281/zenodo.4922819.

Note that, for copyright reasons, the corpus itself cannot be published. If you are interested in using the corpus for non-commercial research purposes and/or in a potential research collaboration, please get in touch with me via [e-mail](#).

B.2 Reference corpora

B.2.1 Spoken BNC2014

The original corpus files of the Spoken British National Corpus (BNC) 2014 (Love et al. 2017; Love et al. 2019) can be downloaded for free for research purposes from: <http://corpora.lancs.ac.uk/bnc2014/signup.php>. I used the untagged XML version.

The R script used to pre-process the untagged XML files into the format used in this study (the “John and Jill in Ivybridge” version with added full stops at speaker turns, as explained in Section 4.3.2.2 of the book) can be found here: https://github.com/elenlefol/TextbookEnglish/blob/main/3_Data/BNCspoken_nomark-up_JackJill.R

B.2.2 Informative Texts for Teens Corpus (Info Teens)

For copyright reasons, the corpus itself cannot be made available. Details of its composition can be found in Section 4.3.2.5 of the book. If you are interested in using this corpus for non-commercial research purposes and/or in a potential research collaboration, please get in touch with me via [e-mail](#).

B.2.3 Youth Fiction corpus

For copyright reasons, the corpus itself cannot be made available. The corresponding meta-data can be found here: https://github.com/elenlefoll/TextbookEnglish/blob/main/3_Data/3_Youth_Fiction_Index.csv. If you are interested in using this corpus for non-commercial research purposes and/or in a potential research collaboration, please get in touch with me via [e-mail](#).

C Linguistic Features

This table provides a tabular overview of the linguistic features tagged by the MFTE Perl at the time of the data analysis.

For more information on the development of the tagger, see Le Foll (2021b) and <https://github.com/elenlefoll/MultiFeatureTaggerEnglish>.

💡 Using the MFTE

The Multi-Feature Tagger of English (MFTE) Perl is free to use and was released under an Open Source licence. If you are interested in using the MFTE for your own project, I recommend using the latest version of the MFTE Python, which is much easier to use, can tag many more features, and also underwent a thorough evaluation. Note also that all future developments of the MFTE will be made on the MFTE Python. To find out more, see Le Foll & Shakir (2023) and <https://github.com/mshakirDr/MFTE>.

The following features were originally considered in this study. This table is also available for download as a PDF at https://github.com/elenlefoll/MultiFeatureTaggerEnglish/blob/main/tables/ListFullMDAFeatures_3.1.pdf.

D Evaluation of the Multi-Feature Tagger of English (MFTE)

For more information on the tagger itself, as well as the evaluation data and methods, see Le Foll (2021b) and <https://github.com/elenlefoll/MultiFeatureTaggerEnglish>.

💡 Using the MFTE

The Multi-Feature Tagger of English (MFTE) Perl is free to use and was released under an Open Source licence. If you are interested in using the MFTE for your own project, I recommend using the latest version of the MFTE Python, which is much easier to use, can tag many more features, and also underwent a thorough evaluation. Note also that all future developments of the tool will be made on the MFTE Python. To find out more, see Le Foll & Shakir (2023) and <https://github.com/mshakirDr/MFTE>.

D.1 Packages required

The following packages must be installed and loaded to process the evaluation data.

```
#renv::restore() # Restore the project's dependencies from the lockfile to
#                 ensure that same package versions are used as in the original thesis.

library(caret) # For computing confusion matrices
library(harrypotter) # Only for colour scheme
library(here) # For path management
library(knitr) # Loaded to display the tables using the kable() function
library(paletteer) # For nice colours
library(readxl) # For the direct import of Excel files
library(tidyverse) # For everything else!
```

D.2 Data import from evaluation files

The data is imported directly from the Excel files in which the manual tag check and corrections was performed. A number of data wrangling steps need to be made for the data to be converted to a tidy format.

```
# Function to import and wrangle the evaluation data from the Excel files in
# which the manual evaluation was conducted
importEval3 <- function(file, fileID, register, corpus) {
  Tag1 <- file |>
    add_column(FileID = fileID, Register = register, Corpus = corpus) |>
    select(FileID, Corpus, Register, Output, Tokens, Tag1, Tag1Gold) |>
    rename(Tag = Tag1, TagGold = Tag1Gold, Token = Tokens) |>
    mutate(Evaluation = ifelse(is.na(TagGold), TRUE, FALSE)) |>
    mutate(TagGold = ifelse(is.na(TagGold), as.character(Tag),
                           as.character(TagGold))) |>
    filter(!is.na(Tag)) |>
    mutate_if(is.character, as.factor)

  Tag2 <- file |>
    add_column(FileID = fileID, Register = register, Corpus = corpus) |>
    select(FileID, Corpus, Register, Output, Tokens, Tag2, Tag2Gold) |>
    rename(Tag = Tag2, TagGold = Tag2Gold, Token = Tokens) |>
    mutate(Evaluation = ifelse(is.na(TagGold), TRUE, FALSE)) |>
    mutate(TagGold = ifelse(is.na(TagGold), as.character(Tag),
                           as.character(TagGold))) |>
    filter(!is.na(Tag)) |>
    mutate_if(is.character, as.factor)

  Tag3 <- file |>
    add_column(FileID = fileID, Register = register, Corpus = corpus) |>
    select(FileID, Corpus, Register, Output, Tokens, Tag3, Tag3Gold) |>
    rename(Tag = Tag3, TagGold = Tag3Gold, Token = Tokens) |>
    mutate(Evaluation = ifelse(is.na(TagGold), TRUE, FALSE)) |>
    mutate(TagGold = ifelse(is.na(TagGold), as.character(Tag),
                           as.character(TagGold))) |>
    filter(!is.na(Tag)) |>
    mutate_if(is.character, as.factor)

  output <- rbind(Tag1, Tag2, Tag3) |>
    mutate(across(where(is.factor), str_remove_all, pattern = fixed(" "))) |> #
      Removes all white spaces which are found in the excel files
```

```

filter(!is.na(Output)) |>
  mutate_if(is.character, as.factor)
}

# Second function to import and wrangle the evaluation data for Excel files
# with four tag columns as opposed to three
importEval4 <- function(file, fileID, register, corpus) {
  Tag1 <- file |>
    add_column(FileID = fileID, Register = register, Corpus = corpus) |>
    select(FileID, Corpus, Register, Output, Tokens, Tag1, Tag1Gold) |>

D.3 Estimating MFTE accuracy for Textbook English

In total, 4,515 tags from the TEC were manually checked. This chunk calculates the recall and precision rates of each feature, ignoring all punctuation and symbols.

```
data <- TaggerEval |>
  filter(Corpus %in% c("TEC-Fr", "TEC-Ger", "TEC-Sp")) |>
  filter(TagGold != "UNCLEAR") |>
  filter(Tag %in% c(str_extract(Tag, "[A-Z0-9]+")))) |> # Remove punctuation
  ↵   tags which are uninteresting here.
  filter(Tag != "SYM" & Tag != "``") |>
  droplevels() |>
  mutate(Tag = factor(Tag, levels = union(levels(Tag), levels(TagGold)))) |>
  ↵   # Ensure that the factor levels are the same for the next caret
  ↵   operation
  mutate(TagGold = factor(TagGold, levels = union(levels(Tag),
  ↵   levels(TagGold)))) |>

# Spot gold tag corrections that are not actually errors (should return zero
  ↵   rows if all is well)
# data[data$Tag==data$TagGold & data$Evaluation == FALSE,] |> as.data.frame()
```

The breakdown of inaccurate vs. accurate tags in this TEC evaluation sample is:

Mode	FALSE	TRUE
logical	114	3831

Note that the following accuracy metrics calculated using the `caret::confusionMatrix` are not very representative because they include tags, which were not entered in the study, e.g., LS and FW.

Accuracy	Kappa	AccuracyLower	AccuracyUpper	AccuracyNull
0.97	0.97	0.97	0.98	0.20
AccuracyPValue	McnemarPValue			
0.00	NaN			

Accuracy metrics per feature are more interesting and relevant.

D.4 MFTE accuracy for reference corpora (or comparable corpora)

D.4.1 Conversation

These are extracts from the Spoken BNC2014 (as entered in the study). The evaluation data for this sample excludes 7 tokens deemed *unclear* by at least one human annotator.

```
data <- TaggerEval |>
  filter(Register == "spoken") |>
  filter(TagGold != "UNCLEAR") |>
  filter(Tag %in% c(str_extract(Tag, "[A-Z0-9]+")))) |> # Remove all
  ↵ punctuation tags which are uninteresting here.
  droplevels() |>
  mutate(Tag = factor(Tag, levels = union(levels(Tag), levels(TagGold)))) |>
  ↵ # Ensure that the factor levels are the same for the next caret
  ↵ operation
  mutate(TagGold = factor(TagGold, levels = union(levels(Tag),
  ↵ levels(TagGold)))) |>

# Spot gold tag corrections that are not actually errors (should return zero
  ↵ rows if all is well)
# data[data$Tag==data$TagGold & data$Evaluation == FALSE,] |> as.data.frame()
```

The breakdown of inaccurate vs. accurate tags in this evaluation sample is:

Mode	FALSE	TRUE
logical	224	5388

Note that the following accuracy metrics calculated using the `caret::confusionMatrix` are not very representative because they include tags, which were not entered in the study, e.g., LS and FW.

	Accuracy	Kappa	AccuracyLower	AccuracyUpper	AccuracyNull
	0.96	0.96	0.95	0.97	0.12
AccuracyPValue					
	0.00	NaN			

D.4.2 Fiction

The evaluation data for this sample excludes 0 tokens deemed *unclear* by at least one human annotator.

```
data <- TaggerEval |>
  filter(Register == "fiction") |>
  filter(TagGold != "UNCLEAR") |>
  filter(Tag %in% c(str_extract(Tag, "[A-Z0-9]+")))) |> # Remove all
  ↵ punctuation tags which are uninteresting here.
  filter(Tag != "SYM" & Tag != "``") |>
  droplevels() |>
  mutate(Tag = factor(Tag, levels = union(levels(Tag), levels(TagGold)))) |>
  ↵ # Ensure that the factor levels are the same for the next caret
  ↵ operation
  mutate(TagGold = factor(TagGold, levels = union(levels(Tag),
  ↵ levels(TagGold)))) |>

# Spot gold tag corrections that are not actually errors (should return zero
  ↵ rows if all is well)
# data[data$Tag==data$TagGold & data$Evaluation == FALSE,] |> as.data.frame()
```

The breakdown of inaccurate vs. accurate tags in this evaluation sample is:

Mode	FALSE	TRUE
logical	168	5346

Note that the following accuracy metrics calculated using the `caret::confusionMatrix` are not very representative because they include tags, which were not entered in the study, e.g., LS and FW.

	Accuracy	Kappa	AccuracyLower	AccuracyUpper	AccuracyNull
	0.97	0.97	0.96	0.97	0.19
AccuracyPValue		McnemarPValue			
	0.00		NaN		

D.4.3 Informative

The evaluation data for this sample excludes 8 tokens deemed *unclear* by at least one human annotator.

```

data <- TaggerEval |>
  filter(Register == "news" | FileID %in% c("BNCBEFor32", "BNCBEB18")) |>
  filter(TagGold != "UNCLEAR") |>
  filter(Tag %in% c(str_extract(Tag, "[A-Z0-9]+")))) |> # Remove all
  ↵ punctuation tags which are uninteresting here.
  filter(Tag != "SYM" & Tag != "``") |>
  droplevels() |>
  mutate(Tag = factor(Tag, levels = union(levels(Tag), levels(TagGold)))) |>
  ↵ # Ensure that the factor levels are the same for the next caret
  ↵ operation
  mutate(TagGold = factor(TagGold, levels = union(levels(Tag),
  ↵ levels(TagGold)))) |>

# Spot gold tag corrections that are not actually errors (should return zero
  ↵ rows if all is well)
# data[data$Tag==data$TagGold & data$Evaluation == FALSE,] |> as.data.frame()

```

The breakdown of inaccurate vs. accurate tags in this evaluation sample is:

	Mode	FALSE	TRUE
	logical	309	7113

Note that the following accuracy metrics calculated using the `caret::confusionMatrix` are not very representative because they include tags, which were not entered in the study, e.g., LS and FW.

	Accuracy	Kappa	AccuracyLower	AccuracyUpper	AccuracyNull
	0.96	0.95	0.95	0.96	0.24
AccuracyPValue	McnemarPValue				
	0.00	NaN			

D.5 Estimating the overall MFTE accuracy for corpora used in the study

```

data <- TaggerEval |>
  filter(TagGold != "UNCLEAR") |>
  filter(Tag %in% c(str_extract(Tag, "[A-Z0-9]+")))) |> # Remove all
  ↵ punctuation tags which are uninteresting here.

```

```

filter(Tag != "SYM" & Tag != "``") |>
filter(TagGold != "SYM" & TagGold != "``") |>
droplevels() |>
mutate(Tag = factor(Tag, levels = union(levels(Tag), levels(TagGold)))) |>
  # Ensure that the factor levels are the same for the next caret
  # operation
mutate(TagGold = factor(TagGold, levels = union(levels(Tag),
  levels(TagGold)))) |>

# Generate a better formatted results table for export: recall, precision and
# f1
confusion_matrix <- cm$table
total <- sum(confusion_matrix)
number_of_classes <- nrow(confusion_matrix)
correct <- diag(confusion_matrix)
# sum all columns
total_actual_class <- apply(confusion_matrix, 2, sum)

```
#ggsave(here("plots", "TaggerAccuracyPlot.svg"), width = 7, height = 12)
```

D.6 Exploring tagger errors

To inspect regular/systematic tagger errors, we add an error tag with the incorrectly assigned tag and underscore and then the correct “gold” label.

```
errors <- TaggerEval |>
  filter(Evaluation=="FALSE") |>
  filter(TagGold != "UNCLEAR") |>
  mutate(Error = paste(Tag, TagGold, sep = " -> "))

FreqErrors <- errors |>
  #filter(Corpus %in% c("TEC-Fr", "TEC-Ger", "TEC-Sp")) |>
  count(Error) |>
  arrange(desc(n))

# Number of error types that only occur once
once <- FreqErrors |>
  filter(n == 1) |>
  nrow()
```

The total number of errors is 817. Of those, 94 occur just once. In total, there are 198 different types of errors. The most frequent 10 are:

```
FreqErrors |>
  filter(n > 10) |>
  kable(digits = 2)
```

Error	n
NCOMP -> NULL	37
NN -> JJAT	35
JJAT -> NN	27
NN -> VB	27
IN -> RP	25
NN -> VPRT	24
VB -> NN	22
THSC -> DEMO	19

Error	n
VB -> VIMP	19
NN -> OCR	16
VBN -> JJAT	16
ACT -> NULL	15
THATD -> NULL	15
CD -> NN	12
MENTAL -> NULL	12
NN -> VBG	11
NN -> VIMP	11
THSC -> THRC	11
VBG -> PROG	11
VBN -> JJPR	11

The code in the following chunk can be used to take a closer look at specific types of frequent errors.

```
errors |>
  filter(Error == "NN -> JJAT") |>
  select(-Output, -Corpus, -Tag, -TagGold) |>
  filter(grepl(x = Token, pattern = "[A-Z]+.")) |>
  kable(digits = 2)
```

For more information on the MFTE evaluation, see (Le Foll 2021b) and <https://github.com/elenlefoll/MultiFeatureTaggerEnglish>.

E Data Preparation for the Model of Intra-Textbook Variation

This script documents the steps taken to pre-process the Textbook English Corpus (TEC) data that were entered in the multi-dimensional model of intra-textbook linguistic variation (Chapter 6).

E.1 Packages required

The following packages must be installed and loaded to process the data.

```
#renv::restore() # Restore the project's dependencies from the lockfile to
← ensure that same package versions are used as in the original study

library(caret) # For its confusion matrix function
library(DT) # To display interactive HTML tables
library(here) # For dynamic file paths
library(knitr) # Loaded to display the tables using the kable() function
library(patchwork) # Needed to put together Fig. 1
library(PerformanceAnalytics) # For the correlation plot
library(psych) # For various useful, stats function
library(tidyverse) # For data wrangling
```

E.2 Data import from MFTE output

The raw data used in this script is a tab-separated file that corresponds to the tabular output of mixed normalised frequencies as generated by the [MFTE Perl v. 3.1](#) (Le Foll 2021b).

```
# Read in Textbook Corpus data
TxCounts <- read.delim(here("data", "MFTE",
← "TxB900MDA_3.1_normed_complex_counts.tsv"), header = TRUE,
← stringsAsFactors = TRUE)
```

```
TxBcounts <- TxBcounts |>
  filter(Filename!=".DS_Store") |>
  droplevels()

#str(TxBcounts) # Check sanity of data
#nrow(TxBcounts) # Should be 2014 files

datatable(TxBcounts,
  filter = "top",
) |>
  formatRound(3:ncol(TxBcounts), digits=2)
```

Metadata was added on the basis of the filenames.

```
# Adding a textbook proficiency level
TxBLevels <- read.delim(here("data", "metadata",
  "TxB900MDA_ProficiencyLevels.csv"), sep = ",")
TxBcounts <- full_join(TxBcounts, TxBLevels, by = "Filename") |>
  mutate(Level = as.factor(Level)) |>
  mutate(Filename = as.factor(Filename))

# Check distribution and that there are no NAs
summary(TxBcounts$Level) |>
  kable(col.names = c("Textbook Level", "# of texts"))
```

Textbook Level	# of texts
A	292
B	407
C	506
D	478
E	331

```

# Check matching on random sample
# TxBcounts |>
#   select(Filename, Level) |>
#   sample_n(20)

# Adding a register variable from the file names
TxBcounts$Register <- as.factor(stringr::str_extract(TxBcounts$Filename,
  ↵ "Spoken|Narrative|Other|Personal|Informative|Instructional|Poetry")) #
  ↵ Add a variable for Textbook Register
summary(TxBcounts$Register) |>
  kable(col.names = c("Textbook Register", "# of texts"))

```

Textbook Register	# of texts
Informative	364
Instructional	647
Narrative	285
Personal	88
Poetry	37
Spoken	593

```

TxBcounts$Register <- car::recode(TxBcounts$Register, "'Narrative' =
  ↵ 'Fiction'; 'Spoken' = 'Conversation'")
#colnames(TxBcounts) # Check all the variables make sense

# Adding a textbook series variable from the file names
TxBcounts$Filename <- stringr::str_replace(TxBcounts$Filename,
  ↵ "English_In_Mind|English_in_Mind", "EIM")
TxBcounts$Filename <- stringr::str_replace(TxBcounts$Filename,
  ↵ "New_GreenLine", "NGL") # Otherwise the regex for GreenLine will override
  ↵ New_GreenLine
TxBcounts$Filename <- stringr::str_replace(TxBcounts$Filename,
  ↵ "Piece_of_cake", "POC") # Shorten label for ease of plotting
TxBcounts$Series <- as.factor(stringr::str_extract(TxBcounts$Filename,
  ↵ "Access|Achievers|EIM|GreenLine|HT|NB|NM|POC|JTT|NGL|Solutions")) #
  ↵ Extract textbook series from (ammended) filenames
summary(TxBcounts$Series) |>
  kable(col.names = c("Textbook Name", "# of texts"))

```

Textbook Name	# of texts
Access	315
Achievers	240

Solutions	327

```
# Adding a textbook country of use variable from the series variable
TxBcounts$Country <- TxBcounts$Series
TxBcounts$Country <- car:::recode(TxBcounts$Series, "c('Access', 'GreenLine',
← 'NGL') = 'Germany'; c('Achievers', 'EIM', 'Solutions') = 'Spain'; c('HT',
← 'NB', 'NM', 'POC', 'JTT') = 'France'"")
summary(TxBcounts$Country) |>
  kable(col.names = c("Country of Use", "# of texts"))
```

Country of Use	# of texts
France	445
Germany	822
Spain	747

```
# Re-order variables
#colnames(TxBcounts)
TxBcounts <- select(TxBcounts, order(names(TxBcounts))) %>%
  select(Filename, Country, Series, Level, Register, Words, everything())
#colnames(TxBcounts)
```

E.2.1 Corpus size

This table provides some summary statistics about the number of words included in the TEC texts originally tagged for this study.

```
TxBcounts |>
  group_by(Register) |>
  summarise(totaltexts = n(), totalwords = sum(Words), mean =
    as.integer(mean(Words)), sd = as.integer(sd(Words)), TTRmean =
    mean(TTR)) |>
  kable(digits = 2, format.args = list(big.mark = ","))
```

Register	totaltexts	totalwords	mean	sd	TTRmean
Conversation	593	505,147	851	301	0.44
Fiction	285	241,512	847	208	0.47
Informative	364	304,695	837	177	0.51
Instructional	647	585,049	904	94	0.42
Personal	88	69,570	790	177	0.48
Poetry	37	26,445	714	192	0.44

```
#TxBcounts <- saveRDS(TxBcounts, here("data", "processed", "TxBcounts.rds"))
```

E.3 Data preparation for PCA

Poetry texts were removed for this analysis as there were too few compared to the other register categories.

```
summary(TxBcounts$Register) |>
  kable(col.names = c("Register", "# texts"))
```

Register	# texts
Conversation	593
Fiction	285
Informative	364
Instructional	647
Personal	88
Poetry	37

This led to the following distribution of texts across the five textbook English registers examined in the model of intra-textbook linguistic variation:

```
TxBcounts <- TxBcounts |>
  filter(Register!="Poetry") |>
  droplevels()

summary(TxBcounts$Register) |>
  kable(col.names = c("Register", "# texts"))
```

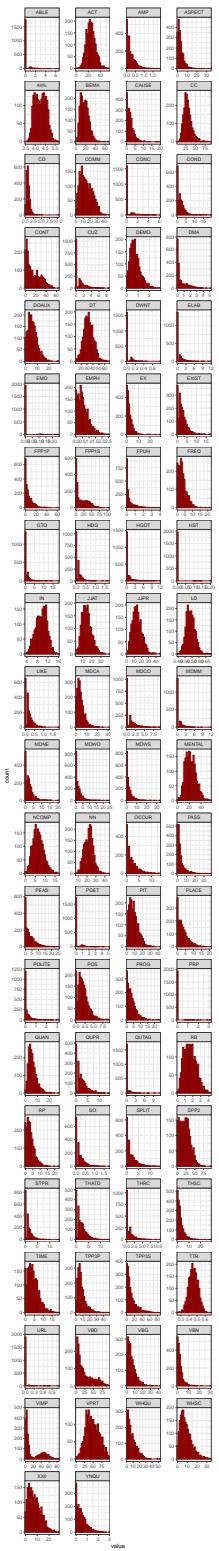

Register	# texts
Conversation	593
Fiction	285
Informative	364
Instructional	647
Personal	88

E.3.1 Feature distributions

The distributions of each linguistic features were examined by means of visualisation. As shown below, before transformation, many of the features displayed highly skewed distributions.

```
TxBcounts |>
  select(-Words) |>
  keep(is.numeric) |>
  tidyrr::gather() |> # This function from tidyrr converts a selection of
  ↵ variables into two variables: a key and a value. The key contains the
  ↵ names of the original variable and the value the data. This means we can
  ↵ then use the facet_wrap function from ggplot2
```

```
ggplot(aes(value)) +
  theme_bw() +
  facet_wrap(~ key, scales = "free", ncol = 4) +
  scale_x_continuous(expand=c(0,0)) +
  geom_histogram(bins = 30, colour= "darkred", fill = "darkred", alpha =
    0.5)
```

```
#ggsave(here("plots", "TEC-HistogramPlotsAllVariablesTEC-only.svg"), width =
  ↵  20, height = 45)
```

E.3.2 Feature removal

A number of features were removed from the dataset as they are not linguistically interpretable. In the case of the TEC, this included the variable CD because numbers spelt out as digits were removed from the textbooks before these were tagged with the MFTE. In addition, the variables LIKE and SO because these are “bin” features included in the output of the MFTE to ensure that the counts for these polysemous words do not inflate other categories due to mistags (Le Foll 2021c).

Whenever linguistically meaningful, very low-frequency features were merged. Finally, features absent from more than third of texts were also excluded. For the analysis intra-textbook register variation, the following linguistic features were excluded from the analysis due to low dispersion:

```
# Removal of meaningless features:
TxBcounts <- TxBcounts |>
  select(-c(CD, LIKE, SO))

# Function to compute percentage of texts with occurrences meeting a
  ↵ condition
compute_percentage <- function(data, condition, threshold) {
  numeric_data <- Filter(is.numeric, data)
  percentage <- round(colSums(condition[, sapply(numeric_data,
  ↵ is.numeric)])/nrow(data) * 100, 2)
  percentage <- as.data.frame(percentage)
  colnames(percentage) <- "Percentage"
  percentage <- percentage |>
    filter(!is.na(Percentage)) |>
    rownames_to_column() |>
    arrange(Percentage)
  if (!missing(threshold)) {
    percentage <- percentage |>
      filter(Percentage > threshold)
  }
  return(percentage)
}

# Calculate percentage of texts with 0 occurrences of each feature
```

```

zero_features <- compute_percentage(TxBcounts, TxBcounts == 0, 66.6)
# zero_features |>
#   kable(col.names = c("Feature", "% texts with zero occurrences"))

# Combine low frequency features into meaningful groups whenever this makes
#   ↵ linguistic sense
TxBcounts <- TxBcounts |>
  mutate(JJPR = ABLE + JJPR, ABLE = NULL) |>
  mutate(PASS = PGET + PASS, PGET = NULL)

# Re-calculate percentage of texts with 0 occurrences of each feature
zero_features2 <- compute_percentage(TxBcounts, TxBcounts == 0, 66.6)
zero_features2 |>
  kable(col.names = c("Feature", "% texts with zero occurrences"))

```

Feature	% texts with zero occurrences
GTO	67.07
ELAB	69.30
MDMM	70.81
HGOT	73.75
CONC	80.48
DWNT	81.44
QUTAG	85.99
URL	96.51
EMO	97.82
PRP	98.33
HST	99.44

```

# Drop variables with low document frequency
TxBcounts <- select(TxBcounts, -one_of(zero_features2$rownames))
#ncol(TxBcounts)-8 # Number of linguistic features remaining

# List of features
#colnames(TxBcounts)

```

These feature removal operations resulted in a feature set of 64 linguistic variables.

E.3.3 Identifying potential outlier texts

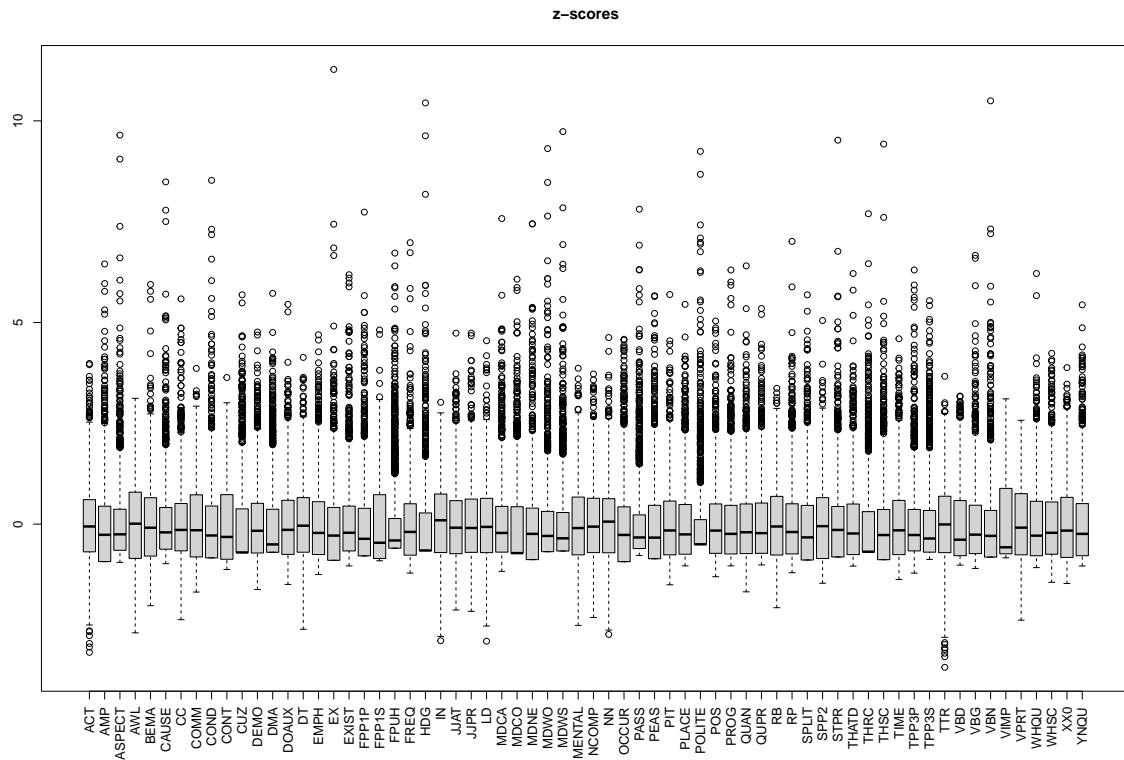

All normalised frequencies were normalised to identify any potential outlier texts.

```

TxBzcounts <- TxBcounts |>
  select(-Words) |>
  keep(is.numeric) |>
  scale()

boxplot(TxBzcounts, las = 3, main = "z-scores") # Slow to open!

```

```

# If necessary, remove any outliers at this stage.
TxBdata <- cbind(TxBcounts[,1:6], as.data.frame(TxBzcounts))

outliers <- TxBdata |>
  select(-c(Word, LD, TTR)) |>
  filter(if_any(where(is.numeric), ~ .x > 8)) |>
  select(Filename)

```

The following outlier texts were identified and excluded in subsequent analyses.

outliers

```
                                Filename
1                  POC_4e_Spoken_0007.txt
2      Solutions_Elementary_Personal_0001.txt
3                  NGL_5_Instructional_0018.txt
4                  Access_1_Spoken_0011.txt
5                  EIM_1_Spoken_0012.txt

```

```
TxBcounts <- TxBcounts |>
  filter(!Filename %in% outliers$Filename)

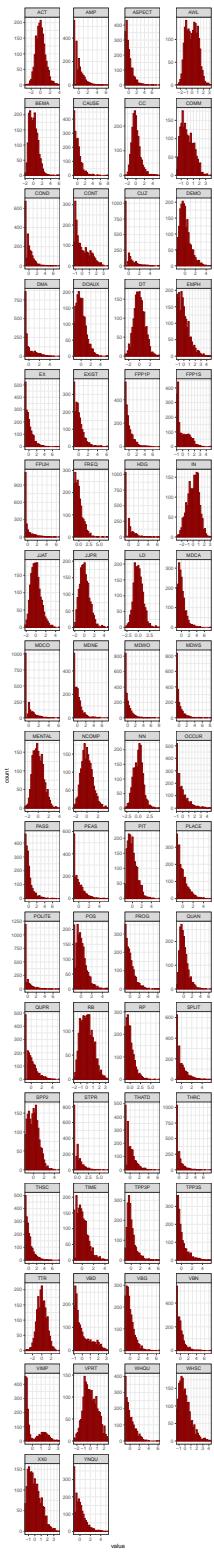

#saveRDS(TxBcounts, here("data", "processed", "TxBcounts3.rds")) # Last saved
← 6 March 2024

TxBzcounts <- TxBcounts |>
  select(-Words) |>
  keep(is.numeric) |>
  scale()
```

This resulted in 1,961 TEC texts being included in the model of intra-textbook linguistic variation with the following standardised feature distributions.

```
TxBzcounts |>
  as.data.frame() |>
  gather() |> # This function from tidyverse converts a selection of variables
  ← into two variables: a key and a value. The key contains the names of
  ← the original variable and the value the data. This means we can then
  ← use the facet_wrap function from ggplot2
  ggplot(aes(value)) +
```

```
theme_bw() +  
facet_wrap(~ key, scales = "free", ncol = 4) +  
scale_x_continuous(expand=c(0,0)) +  
geom_histogram(bins = 30, colour= "darkred", fill = "darkred", alpha =  
 0.5)
```

```
#ggsave(here("plots", "TEC-zscores-HistogramsAllVariablesTEC-only.svg"),
  ↵ width = 20, height = 45)
```

E.3.4 Signed log transformation

A signed logarithmic transformation was applied to (further) deskew the feature distributions (Diwersy, Evert & Neumann 2014; Neumann & Evert 2021).

The signed log transformation function was inspired by the SignedLog function proposed in <https://cran.r-project.org/web/packages/DataVisualizations/DataVisualizations.pdf>

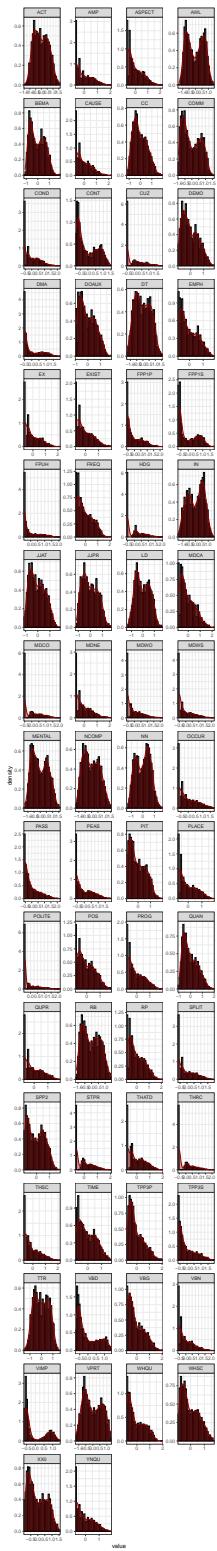

```
# All features are signed log-transformed (note that this is also what
  ↵ Neumann & Evert 2021 propose)
signed.log <- function(x) {
  sign(x) * log(abs(x) + 1)
}

TxBzlogcounts <- signed.log(TxBzcounts) # Standardise first, then signed log
  ↵ transform

#saveRDS(TxBzlogcounts, here("data", "processed", "TxBzlogcounts.rds")) #
  ↵ Last saved 6 March 2024
```

The new feature distributions are visualised below.

```
TxBzlogcounts |>
  as.data.frame() |>
  gather() |> # This function from tidyverse converts a selection of variables
    ↵ into two variables: a key and a value. The key contains the names of
    ↵ the original variable and the value the data. This means we can then
    ↵ use the facet_wrap function from ggplot2
  ggplot(aes(value, after_stat(density))) +
  theme_bw() +
  facet_wrap(~ key, scales = "free", ncol = 4) +
  scale_x_continuous(expand=c(0,0)) +
  scale_y_continuous(limits = c(0,NA)) +
  geom_histogram(bins = 30, colour= "black", fill = "grey") +
  geom_density(colour = "darkred", weight = 2, fill="darkred", alpha = .4)
```

```
#ggsave(here("plots", "DensityPlotsAllVariablesSignedLog-TEC-only.svg"),
  width = 15, height = 49)
```

The following correlation plots serve to illustrate the effect of the variable transformations performed in the above chunks.

Example feature distributions before transformations:

```
# This is a slightly amended version of the
# PerformanceAnalytics::chart.Correlation() function. It simply removes the
# significance stars that are meaningless with this many data points (see
# commented out lines below)

chart.Correlation.nostars <- function (R, histogram = TRUE, method =
  c("pearson", "kendall", "spearman"), ...) {
  x = checkData(R, method = "matrix")
  if (missing(method))
    method = method[1]
  panel.cor <- function(x, y, digits = 2, prefix = "", use =
    "pairwise.complete.obs", method = "pearson", cex.cor, ...) {
    usr <- par("usr")
    on.exit(par(usr))
    par(usr = c(0, 1, 0, 1))
    r <- cor(x, y, use = use, method = method)
    txt <- format(c(r, 0.123456789), digits = digits)[1]
    txt <- paste(prefix, txt, sep = "")
    if (missing(cex.cor))
      cex <- 0.8/strwidth(txt)
    test <- cor.test(as.numeric(x), as.numeric(y), method = method)
    # Signif <- symnum(test$p.value, corr = FALSE, na = FALSE,
    #                   cutpoints = c(0, 0.001, 0.01, 0.05, 0.1, 1), symbols =
    #                   c("***",
    #                   **", "*",
    #                   ".",
    #                   ""))
    text(0.5, 0.5, txt, cex = cex * (abs(r) + 0.3)/1.3)
    # text(0.8, 0.8, Signif, cex = cex, col = 2)
  }
  f <- function(t) {
    dnorm(t, mean = mean(x), sd = sd.xts(x))
  }
  dotargs <- list(...)
  dotargs$method <- NULL
```

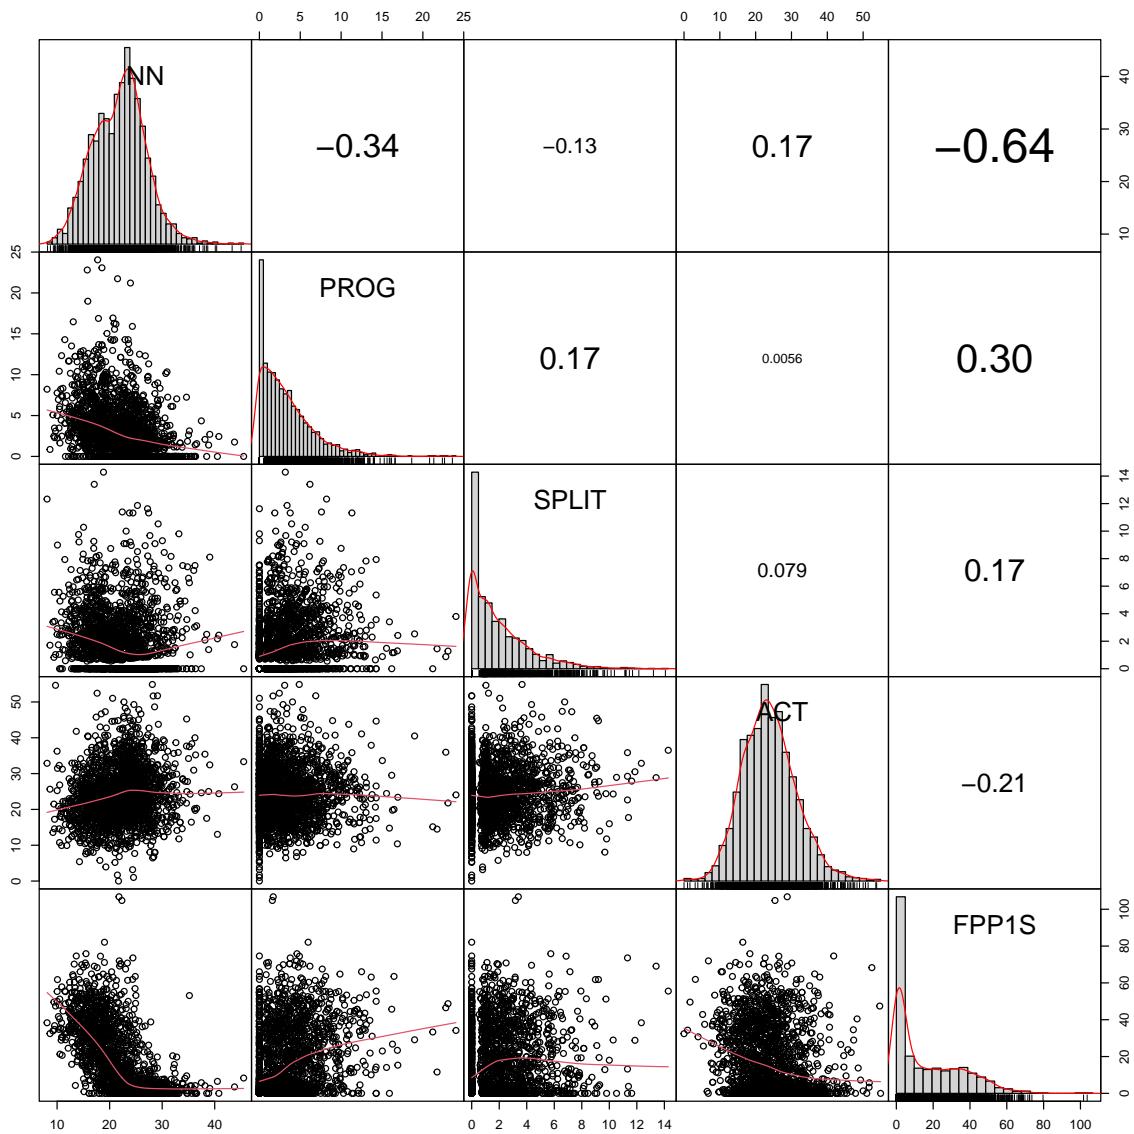

```

rm(method)
hist.panel = function(x, ... = NULL) {
  par(new = TRUE)
  hist(x, col = "light gray", probability = TRUE,
    axes = FALSE, main = "", breaks = "FD")
  lines(density(x, na.rm = TRUE), col = "red", lwd = 1)
  rug(x)
}
if (histogram)
  pairs(x, gap = 0, lower.panel = panel.smooth, upper.panel = panel.cor,
    diag.panel = hist.panel)
else pairs(x, gap = 0, lower.panel = panel.smooth, upper.panel = panel.cor)
}

# Example plot without any variable transformation
example1 <- TxBcounts |>
  select(NN,PROG,SPLIT,ACT,FPP1S)

#png(here("plots", "CorrChart-TEC-examples-normedcounts.png"), width = 20,
#  height = 20, units = "cm", res = 300)
chart.Correlation.nostars(example1, histogram=TRUE, pch=19)

```

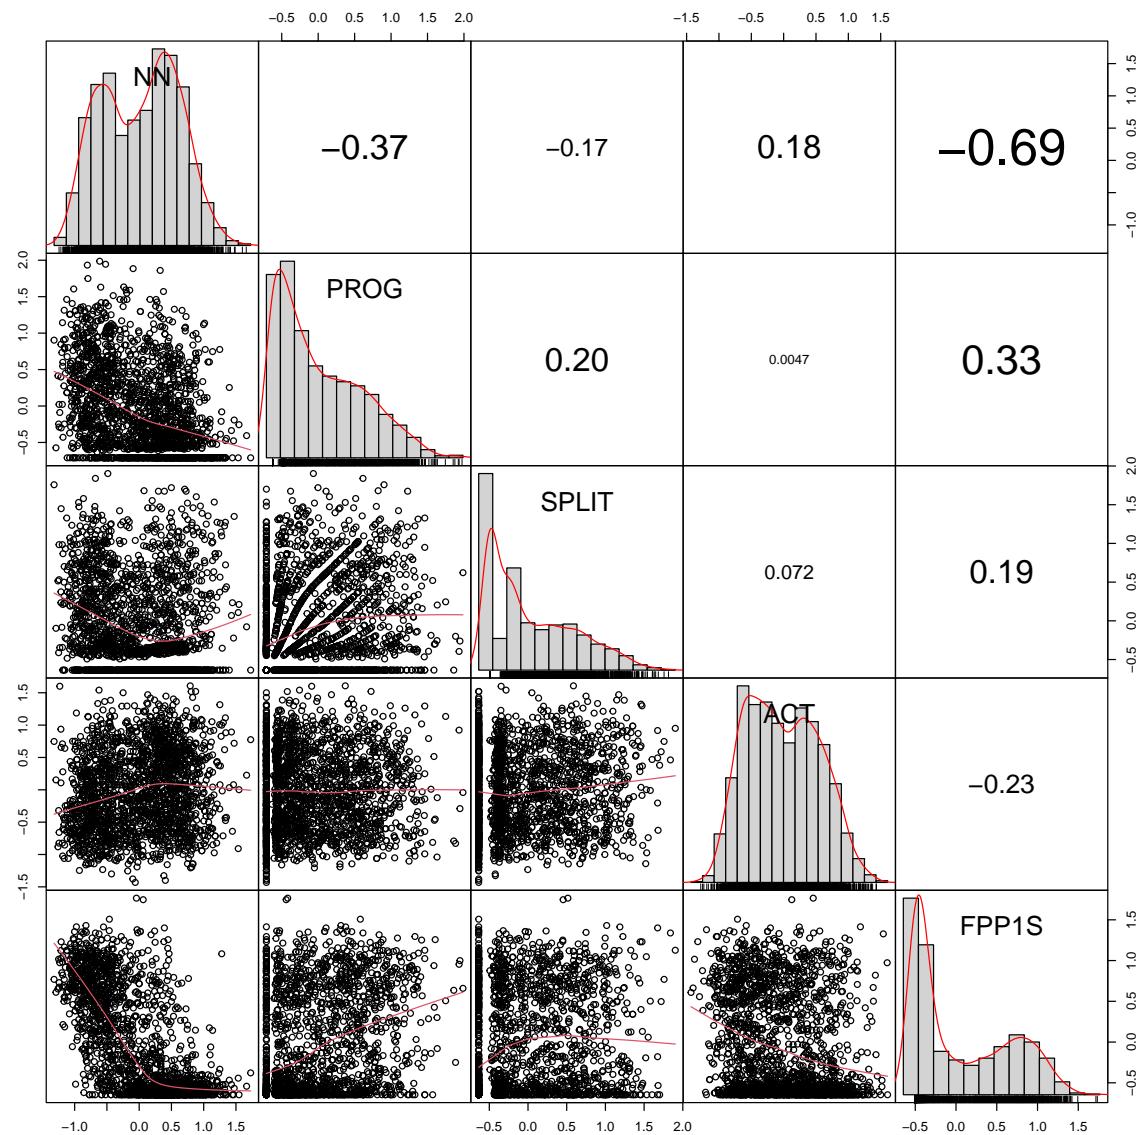

```
#dev.off()
```

Example feature distributions after transformations:

```
# Example plot with transformed variables
example2 <- TxBzlogcounts |>
  as.data.frame() |>
  select(NN,PROG,SPLIT,ACT,FPP1S)
```

```
#png(here("plots", "CorrChart-TEC-examples-zsignedlogcounts.png"), width =
  ↵ 20, height = 20, units = "cm", res = 300)
chart.Correlation.nostars(example2, histogram=TRUE, pch=19)
```

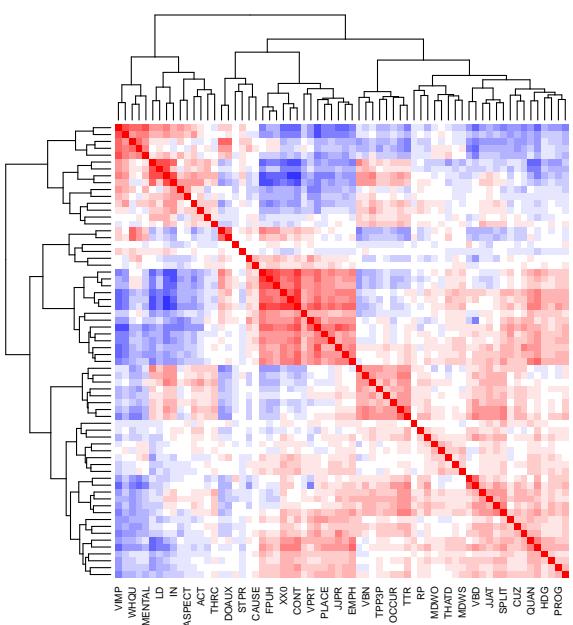

```
#dev.off()
```

E.3.5 Feature correlations

The correlations of the transformed feature frequencies can be visualised in the form of a heatmap. Negative correlations are rendered in blue, whereas positive ones are in red.

```
# Simple heatmap in base R (inspired by Stephanie Evert's SIGIL code)
cor.colours <- c(
  hsv(h=2/3, v=1, s=(10:1)/10), # blue = negative correlation
  rgb(1,1,1), # white = no correlation
  hsv(h=0, v=1, s=(1:10/10))) # red = positive correlation

#png(here("plots", "heatmapzlogcounts-TEC-only.png"), width = 30, height= 30,
#  units = "cm", res = 300)
heatmap(cor(TxBzlogcounts),
        symm=TRUE,
        zlim=c(-1,1),
        col=cor.colours,
        margins=c(0,0))
```

```
#dev.off()

# Calculate the sum of all the words in the tagged texts of the TEC
totalwords <- TxBcounts |>
  select(Words) |>
  sum() |>
  format(big.mark=",")
```

E.4 Composition of TEC texts/files

These figures and tables provide summary statistics on the texts/files of the TEC that were entered in the multi-dimensional model of intra-textbook linguistic variation. In total, the TEC texts entered amounted to 1,693,650 words.

```
metadata <- TxBcounts |>

F Data Analysis for the Model of Intra-Textbook Variation

This script documents the analysis of the pre-processed data from the Textbook English Corpus (TEC) to arrive at the multi-dimensional model of intra-textbook linguistic variation (Chapter 6). It generates all of the statistics and plots included in the book, as well as many others that were used in the analysis, but not included in the book for reasons of space.

F.1 Packages required

The following packages must be installed and loaded to carry out the following analyses.

```
#renv::restore() # Restore the project's dependencies from the lockfile to
#                ensure that same package versions are used as in the original study

library(caret) # For its confusion matrix function
library(cowplot)
library(DescTools) # For 95% CI
library(emmeans)
library(factoextra) # For circular graphs of variables
library(forcats) # For data manipulation
library(ggthemes) # For theme of factoextra plots
library(here) # For dynamic file paths
library(knitr) # Loaded to display the tables using the kable() function
library(lme4) # For linear regression modelling
library(patchwork) # To create figures with more than one plot
library(PCAtools) # For nice biplots of PCA results
library(psych) # For various useful stats function
library(sjPlot) # For model plots and tables
library(tidyverse) # For data wrangling
library(visreg) # For plots of interaction effects

# From https://github.com/RainCloudPlots/RainCloudPlots:
source(here("R_rainclouds.R")) # For geom_flat_violin rainplots
```

F.2 Preparing the data for PCA

F.2.1 TEC data import

```
TxBcounts <- readRDS(here("data", "processed", "TxBcounts3.rds"))
# colnames(TxBcounts)
# nrow(TxBcounts)

TxBzlogcounts <- readRDS(here("data", "processed", "TxBzlogcounts.rds"))
# nrow(TxBzlogcounts)
# colnames(TxBzlogcounts)

TxBdata <- cbind(TxBcounts[,1:6], as.data.frame(TxBzlogcounts))
# str(TxBdata)
```

First, the TEC data as processed in Appendix D is imported. It comprises 1,961 texts/files, each with logged standardised normalised frequencies for 66 linguistic features.

F.3 Checking the factorability of data

```
kmo <- KMO(TxBdata[,7:ncol(TxBdata)])
```

The overall MSA value of the dataset is 0.86. The features have the following individual MSA values (ordered from lowest to largest):

```
kmo$MSAi[order(kmo$MSAi)] |> round(2)
```

	MDWO	MDWS	MDNE	MDCA	VBD	VPRT	POS	ACT	FREQ	TPP3S	LD
	0.34	0.46	0.52	0.53	0.59	0.60	0.64	0.65	0.65	0.66	0.68
CAUSE	COND	MDCO	VIMP	NCOMP		DT	TPP3P	STPR	RP	SPP2	MENTAL
	0.69	0.75	0.77	0.78	0.79	0.80	0.80	0.81	0.81	0.83	0.84
DOAUX	WHSC	VBG	EXIST	THATD		COMM	FPP1S	IN	NN	WHQU	JJAT
	0.84	0.85	0.86	0.86	0.86	0.87	0.87	0.88	0.88	0.89	0.89

0.95	0.95	0.95	0.95	0.95	0.96	0.96	0.96	0.96	0.96	0.97

F.3.1 Removal of feature with MSAs of < 0.5

We first remove the first feature with an individual MSA < 0.5, then check the MSA values again and continue removing features one by one if necessary.

```
TxBdata <- TxBdata |>
  select(-c(MDW0))

kmo2 <- KMO(TxBdata[, 7:ncol(TxBdata)])
```

The overall MSA value of the dataset is now 0.87. None of the remaining features have individual MSA values below 0.5:

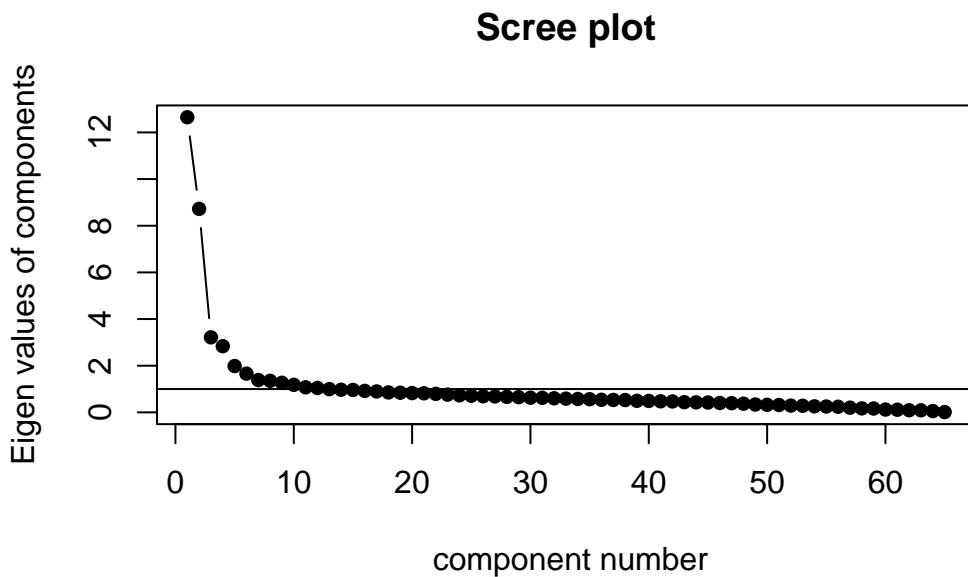

```
kmo2$MSAi [order(kmo2$MSAi)] |> round(2)
```

MDWS	MDNE	MDCA	VBD	POS	VPRT	FREQ	ACT	TPP3S	LD	CAUSE

0.95	0.95	0.96	0.96	0.96	0.96	0.96	0.96	0.96	0.97	

F.3.2 Choosing the number of principal components to retain

On the basis of this scree plot, six principal components were initially retained.

```
# Plot screen plot
#png(here("plots", "screeplot-TEC-only.png"), width = 20, height= 12, units =
#  "cm", res = 300)
scree(TxBdata[, 7:ncol(TxBdata)], factors = FALSE, pc = TRUE) # Retain six
# components
```

```
#dev.off()

# Perform PCA
pca1 <- psych::principal(TxBdata[, 7:ncol(TxBdata)],
                           nfactors = 6,
                           rotate = "none")
#pca1$loadings
```

F.3.3 Excluding features with low final communalities

We first check whether some feature have extremely low communalities (see <https://rdrr.io/cran/FactorAssumptions/man/communal.html>)

STPR	MDNE	HDG	CAUSE	FREQ	THRC	POS	PROG	ACT	DEMO	MDWS
0.09	0.17	0.17	0.19	0.22	0.22	0.24	0.26	0.26	0.27	0.28
CUZ	COND	QUPR	EXIST	MDC0	NCOMP	OCCUR	TIME	ASPECT	TPP3P	AMP

0.95	0.96	0.96	0.96	0.96	0.97					

The final number of linguistic features entered in the intra-textbook model of linguistic variation is 61.

F.4 Testing the effect of rotating the components

This chunk was used when considering whether or not to rotate the components (see methods section). Ultimately, the components were not rotated.

```

# Comparing a rotated vs. a non-rotated solution

#TxBdata <- readRDS(here("data", "processed", "TxBdataforPCA.rds"))

# No rotation
pca2 <- psych::principal(TxBdata[,7:ncol(TxBdata)],
                           nfactors = 6,
                           rotate = "none")

pca2$loadings

biplot.psych(pca2,
              vars = TRUE,
              choose=c(1,2),
              )

# Promax rotation
pca2.rotated <- psych::principal(TxBdata[,7:ncol(TxBdata)],
                                   nfactors = 6,
                                   rotate = "promax")

# This summary shows the component correlations which is particularly
# interesting
pca2.rotated

pca2.rotated$loadings

biplot.psych(pca2.rotated, vars = TRUE, choose=c(1,2))

```

F.5 Principal Component Analysis (PCA)

F.5.1 Using the full dataset

Except outliers removed as part of the data preparation (see Appendix D).

```

# Perform PCA on full data
TxBdata <- readRDS(here("data", "processed", "TxBdataforPCA.rds"))

```

F.5.2 Using random subsets of the data

Alternatively, it is possible to conduct the PCA on random subsets of the data to test the stability of the solution. Re-running this line will generate a new subset of the TEC texts containing 2/3 of the texts randomly sampled.

```
TxBdata <- readRDS(here("data", "processed", "TxBdataforPCA.rds")) |>
  slice_sample(n = round(1961*0.6), replace = FALSE)

nrow(TxBdata)
TxBdata$Filename[1:10]
nrow(TxBdata) / (ncol(TxBdata)-6) # Check that there is enough data to
  ↵ conduct a PCA. This ratio should be at least 5 (see Friginal & Hardy
  ↵ 2014: 303-304).
```

F.5.3 Using specific subsets of the data

The following chunk can be used to perform the PCA on a country subset of the data to test the stability of the solution. See (Le Foll) for a detailed analysis of the subcorpus of textbooks used in Germany.

```
TxBdata <- readRDS(here("data", "processed", "TxBdataforPCA.rds")) |>
  #filter(Country == "France")
  #filter(Country == "Germany")
  filter(Country == "Spain")

nrow(TxBdata)
TxBdata$Filename[1:10] # Check data
nrow(TxBdata) / (ncol(TxBdata)-6) # Check that there is enough data to
  ↵ conduct a PCA. This should be > 5 (see Friginal & Hardy 2014: 303-304).
```

F.5.4 Performing the PCA

We perform the PCA using the `prcomp` function and print a summary of the results.

```
pca <- prcomp(TxBdata[, 7:ncol(TxBdata)], scale.=FALSE, rank. = 6) # All
  ↵ quantitative variables for all TxB files except outliers
register <- factor(TxBdata[, "Register"]) # Register
level <- factor(TxBdata[, "Level"]) # Textbook proficiency level
```

```
# summary(register)
# summary(level)
summary(pca)
```

```
Importance of first k=6 (out of 61) components:
          PC1      PC2      PC3      PC4      PC5      PC6
Standard deviation    2.1693 1.7776 1.08902 1.00207 0.84288 0.76792
Proportion of Variance 0.2108 0.1416 0.05313 0.04499 0.03183 0.02642
Cumulative Proportion 0.2108 0.3524 0.40553 0.45051 0.48234 0.50876
```

F.6 Plotting PCA results

F.6.1 3D plots

The following chunk can be used to create projections of TEC texts on three dimensions of the model. These plots cannot be rendered in two dimensions and are therefore not generated in the present document. For more information on the `pca3d` library, see: <https://cran.r-project.org/web/packages/pca3d/vignettes/pca3d.pdf>.

```
library(pca3d) # For 3-D plots

col <- palette[c(1:3,8,7)] # without poetry
names(col) <- c("Conversation", "Fiction", "Informative", "Instructional",
  ↵ "Personal")
scales::show_col(col) # Check colours

pca3d(pca,
  group = register,
  components = 1:3,
  #components = 4:6,
  show.ellipses=FALSE,
  ellipse.ci=0.75,
  show.plane=FALSE,
  col = col,
  shape = "sphere",
  radius = 1,
  legend = "right")

snapshotPCA3d(here("plots", "PCA_TxB_3Dsnapshot.png"))
```

```

names(col) <- c("C", "B", "E", "A", "D") # To colour the dots according to
  ↴ the proficiency level of the textbooks
pca3d(pca,
       components = 4:6,
       group = level,
       show.ellipses=FALSE,
       ellipse.ci=0.75,
       show.plane=FALSE,
       col = col,
       shape = "sphere",
       radius = 0.8,
       legend = "right")

```

F.7 Two-dimensional plots (biplots)

These plots were generated using the `PCAtools` package, which requires the data to be formatted in a rather unconventional way so it needs to wrangled first.

F.7.1 Data wrangling for PCAtools

```

#TxBdata <- readRDS(here("data", "processed", "TxBdataforPCA.rds"))

TxBdata2meta <- TxBdata[,1:6]
rownames(TxBdata2meta) <- TxBdata2meta$Filename
TxBdata2meta <- TxBdata2meta |> select(-Filename)
#head(TxBdata2meta)

TxBdata2 = TxBdata
rownames(TxBdata2) <- TxBdata2$Filename
TxBdata2num <- as.data.frame(base::t(TxBdata2[,7:ncol(TxBdata2)]))
#TxBdata2num[1:12,1:3] # Check sanity of data

p <- PCAtools::pca(TxBdata2num,
                    metadata = TxBdata2meta,
                    scale = FALSE)

```

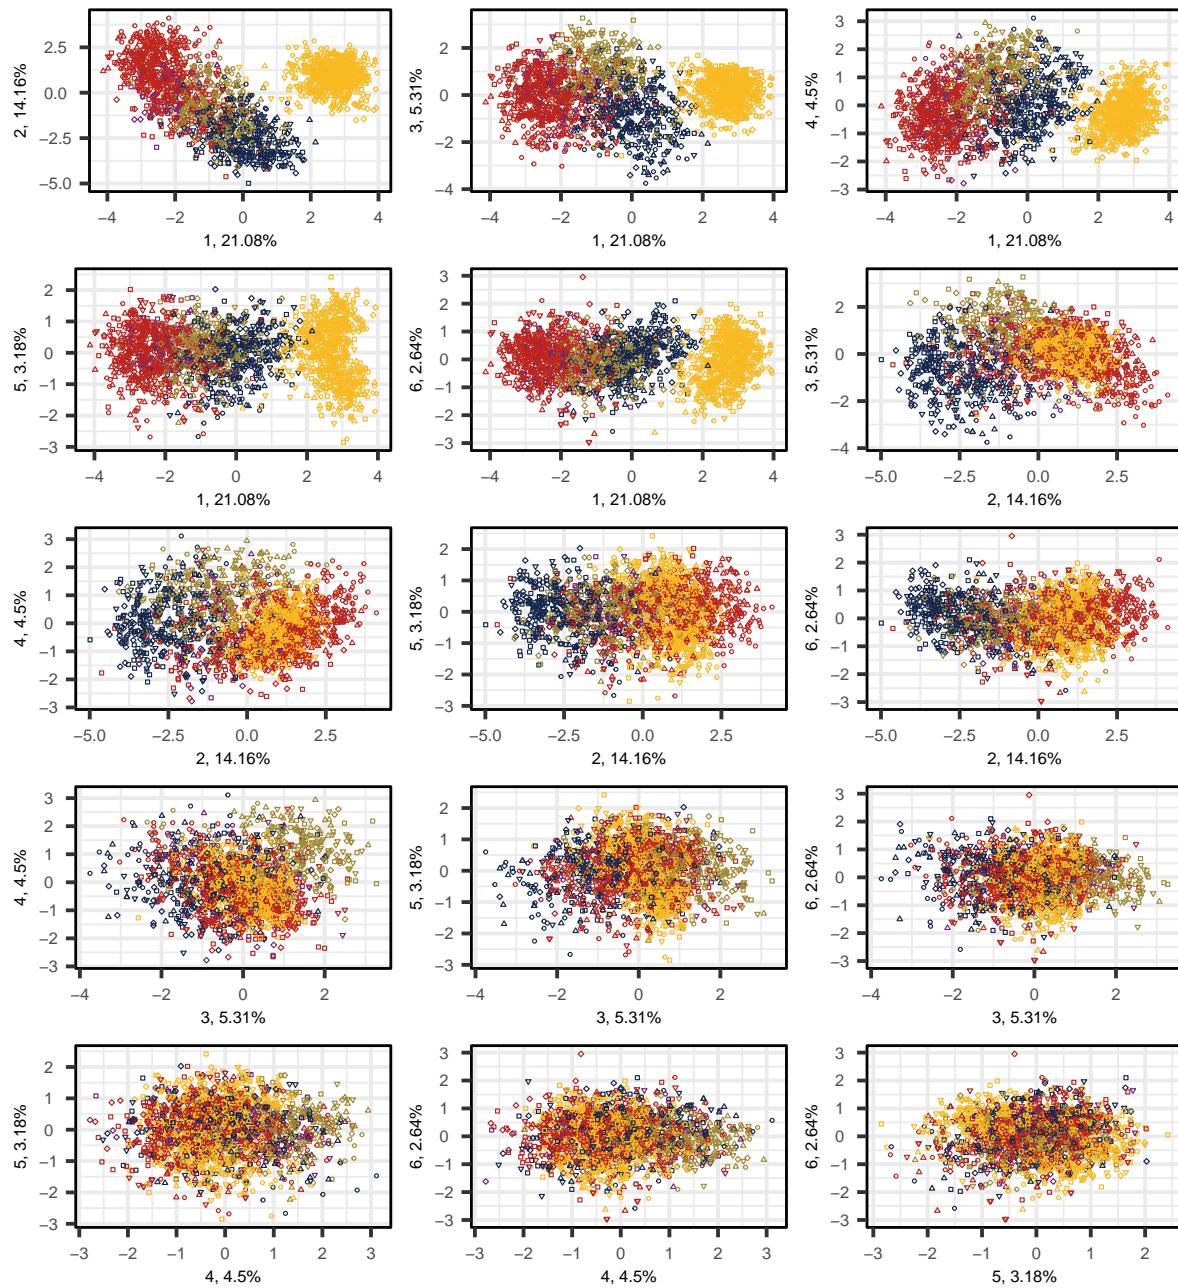

F.7.2 Pairs plot

We first produce a scatterplot matrix of all the combinations of the first six dimensions of the model of intra-textbook variation. Note that the number before the comma on each axis label shows which principal component is plotted on that axis; this is followed by the percentage of the total variance explained by that particular component. The colours correspond to the text registers.

```
## Colour and shape scheme for all biplots
colkey = c(Conversation="#BD241E", Fiction="#A18A33", Informative="#15274D",
          ↵ Instructional="#F9B921", Personal="#722672")
shapekey = c(A=1, B=2, C=6, D=0, E=5)

## Very slow, open in zoomed out window!
# Add legend manually? Yes (take it from the biplot code below), sadly really
  ↵ the simplest solution, here. Or use Evert's mvar.pairs plot function
  ↵ (though that also requires manual axis annotation).

# png(here("plots", "PCA_TxB_pairsplot.png"), width = 12, height= 19, units =
  ↵ "cm", res = 300)
PCAtools::pairsplot(p,
                     triangle = FALSE,
                     components = 1:6,
                     ncol = 3,
                     nrow = 5,
                     pointSize = 0.8,
                     lab = NULL, # Otherwise will try to label each data point!
                     colby = "Register",
                     colkey = colkey,
                     shape = "Level",
                     shapekey = shapekey,
                     margin gaps = unit(c(0.2, 0.2, 0.2, 0.2), "cm"),
                     legendPosition = "none")
```

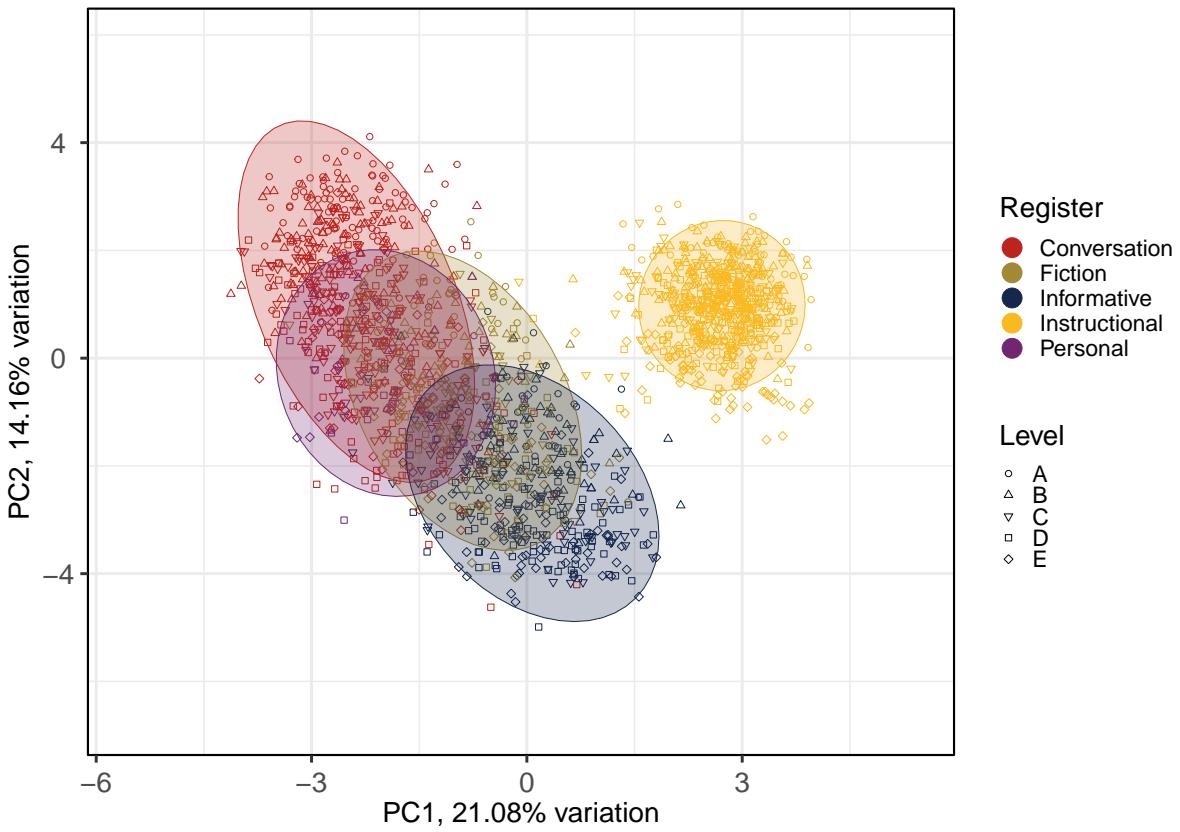

F.7.3 Bi-plots

Then, biplots of the most important dimensions are generated to examine components more carefully.

```
colkey = c(Conversation="#BD241E", Fiction="#A18A33", Informative="#15274D",
         ↵ Instructional="#F9B921", Personal="#722672")
shapekey = c(A=1, B=2, C=6, D=0, E=5)

#png(here("plots", "PCA_TxB_Biplot_PC1_PC2.png"), width = 40, height= 25,
     ↵ units = "cm", res = 300)
PCAtools::biplot(p,
                  x = "PC1",
                  y = "PC2",
                  lab = NULL, # Otherwise will try to label each data point!
                  xlim = c(min(p$rotated$PC1)-0.5, max(p$rotated$PC1)+0.5),
                  ylim = c(min(p$rotated$PC2)-0.5, max(p$rotated$PC2)+0.5),
                  colby = "Register",
                  pointSize = 2,
                  colkey = colkey,
                  shape = "Level",
                  shapekey = shapekey,
                  showLoadings = FALSE,
                  ellipse = TRUE,
                  axisLabSize = 22,
                  legendPosition = 'right',
                  legendTitleSize = 22,
                  legendLabSize = 18,
                  legendIconSize = 7) +
theme(plot.margin = unit(c(0,0,0,0.2), "cm"))
```

```
#dev.off()
#ggsave(here("plots", "PCA_TxB_BiplotPC1_PC2.svg"), width = 12, height = 10)
```

```
# Biplots to examine components more carefully
pRegisters <- PCAtools::biplot(p,
  x = "PC3",
  y = "PC4",
  lab = NULL, # Otherwise will try to label each data point!
  colby = "Register",
  pointSize = 2,
  colkey = colkey,
  shape = "Level",
  shapekey = shapekey,
  showLoadings = FALSE,
  ellipse = TRUE,
  legendPosition = 'right',
```

```

        legendTitleSize = 22,
        legendLabSize = 18,
        legendIconSize = 7) +
theme(plot.margin = unit(c(0,0,0,0.2), "cm"))

#ggsave(here("plots", "PCA_TxB_BiplotPC3_PC4.svg"), width = 12, height = 10)

# Biplots to examine components more carefully
pRegisters2 <- PCAtools::biplot(p,
  x = "PC5",
  y = "PC6",
  lab = NULL, # Otherwise will try to label each data point!
  colby = "Register",
  pointSize = 2,
  colkey = colkey,
  shape = "Level",
  shapekey = shapekey,
  showLoadings = FALSE,
  ellipse = TRUE,
  legendPosition = 'right',
  legendTitleSize = 22,
  legendLabSize = 18,
  legendIconSize = 7) +
theme(plot.margin = unit(c(0,0,0,0.2), "cm"))

#ggsave(here("plots", "PCA_TxB_BiplotPC5_PC6.svg"), width = 12, height = 10)

```

Changing the colour of the points and the ellipses to represent the texts' target proficiency levels instead of the register allows for a different interpretation of the model.

```

# Inverted keys for the biplots with ellipses for Level rather than Register
colkeyLevels = c(A="#F9B921", B="#A18A33", C="#BD241E", D="#722672",
  ↵ E="#15274D")
shapekeyLevels = c(Conversation=1, Fiction=2, Informative=6, Instructional=0,
  ↵ Personal=5)

pLevels <- PCAtools::biplot(p,
  x = "PC3",
  y = "PC4",
  lab = NULL, # Otherwise will try to label each data point!
  #xlim = c(min(p$rotated$PC1)-0.5, max(p$rotated$PC1)+0.5),

```

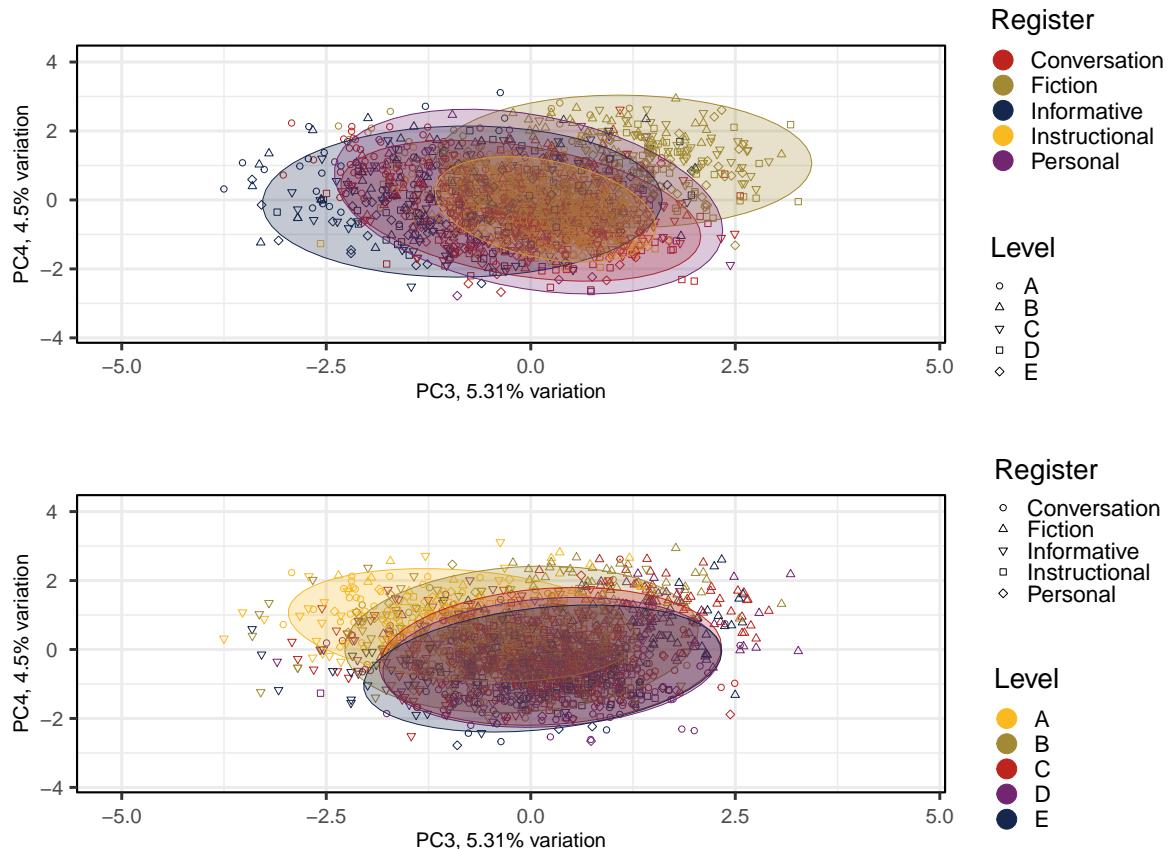

```

    #ylim = c(min(p$rotated$PC2)-0.5, max(p$rotated$PC2)+0.5),
    colby = "Level",
    pointSize = 2,
    colkey = colkeyLevels,
    shape = "Register",
    shapekey = shapekeyLevels,
    showLoadings = FALSE,
    ellipse = TRUE,
    legendPosition = 'right',
    legendTitleSize = 22,
    legendLabSize = 18,
    legendIconSize = 7) +
  theme(plot.margin = unit(c(0,0,0,0.2), "cm"))
#ggsave(here("plots", "PCA_TxB_BiplotPC3_PC4_Level.svg"), width = 12, height
  ← = 10)

Graphs of features display the features with the strongest contributions to any two dimensions of the model of intra-textbook variation. They are created using the `factoextra::fviz_pca_var` function.

```
factoextra::fviz_pca_var(pca,
  axes = c(1,2),
  select.var = list(cos2 = 0.1),
  col.var = "contrib", # Colour by contributions to the PC
  gradient.cols = c("#F9B921", "#DB241E", "#722672"),
  title = "",
  repel = TRUE, # Try to avoid too much text overlapping
  ggtheme = ggthemes::theme_few())
```

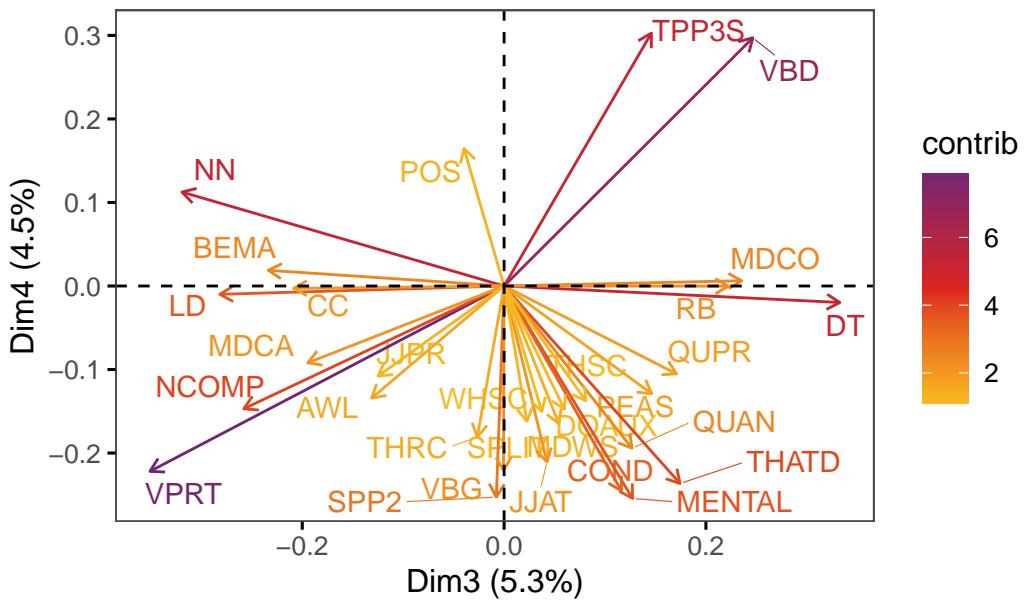

```
#ggsave(here("plots", "fviz_pca_var_PC1_PC2.svg"), width = 11, height = 9)

factoextra::fviz_pca_var(pca,
  axes = c(3,2),
  select.var = list(contrib = 30),
  col.var = "contrib", # Colour by contributions to the PC
  gradient.cols = c("#F9B921", "#DB241E", "#722672"),
  title = "",
  repel = TRUE, # Try to avoid too much text overlapping
  ggtheme = ggthemes::theme_few())
```

```
#ggsave(here("plots", "fviz_pca_var_PC3_PC2.svg"), width = 9, height = 8)

factoextra::fviz_pca_var(pca,
  axes = c(3,4),
  select.var = list(contrib = 30),
  col.var = "contrib", # Colour by contributions to the PC
  gradient.cols = c("#F9B921", "#DB241E", "#722672"),
  title = "",
  repel = TRUE, # Try to avoid too much text overlapping
  ggtheme = ggthemes::theme_few())
```

```
#ggsave(here("plots", "fviz_pca_var_PC3_PC4.svg"), width = 9, height = 8)
```

F.9 Exploring the dimensions of the model

We begin with some descriptive statistics of the dimension scores.

```
#  
#<-- http://www.sthda.com/english/articles/31-principal-component-methods-in-r-practical-guide  
  
#TxBdata <- readRDS(here("data", "processed", "TxBdataforPCA.rds"))  
  
pca <- prcomp(TxBdata[, 7:ncol(TxBdata)], scale.=FALSE) # All quantitative  
#<-- variables for all TxB files

F.10 Computing mixed-effects models of the dimension scores

F.10.1 Dimension 1: ‘Overt instructions and explanations’

Having compared various models, the following model is chosen as the best-fitting one.

```
# Models with Textbook series as random intercepts
md1 <- lmer(PC1 ~ Register*Level + (1|Series), data = res.ind, REML = FALSE)
md1Register <- lmer(PC1 ~ Register + (1|Series), data = res.ind, REML =
  FALSE)
md1Level <- lmer(PC1 ~ Level + (1|Series), data = res.ind, REML = FALSE)
```

```

anova(md1, md1Register, md1Level)

Data: res.ind
Models:
md1Register: PC1 ~ Register + (1 | Series)
md1Level: PC1 ~ Level + (1 | Series)
md1: PC1 ~ Register * Level + (1 | Series)

line=list(col="darkred"),
xlab = "Textbook Level", ylab = "PC4"
#,gg = TRUE
,layout=c(5,1)
)
```

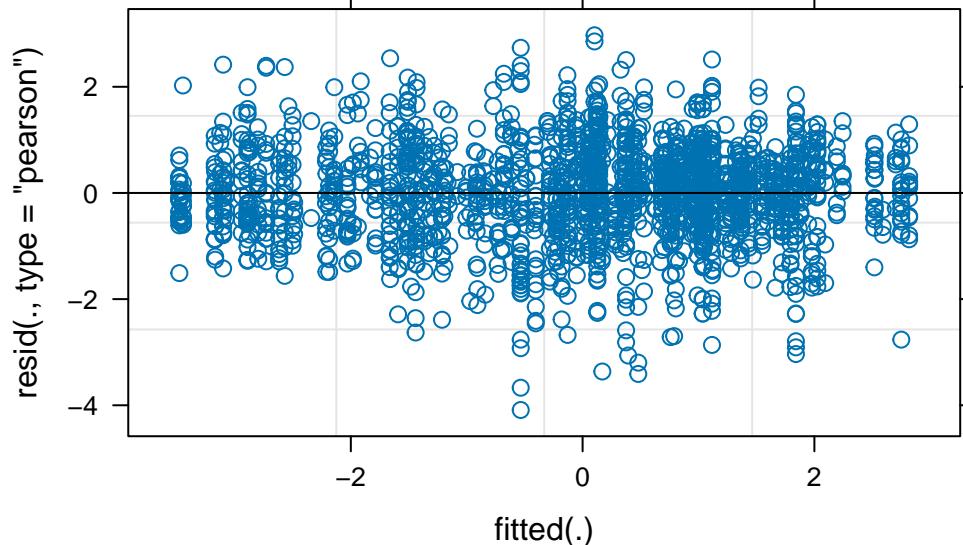

```
# dev.off()
```

F.10.5 Testing model assumptions

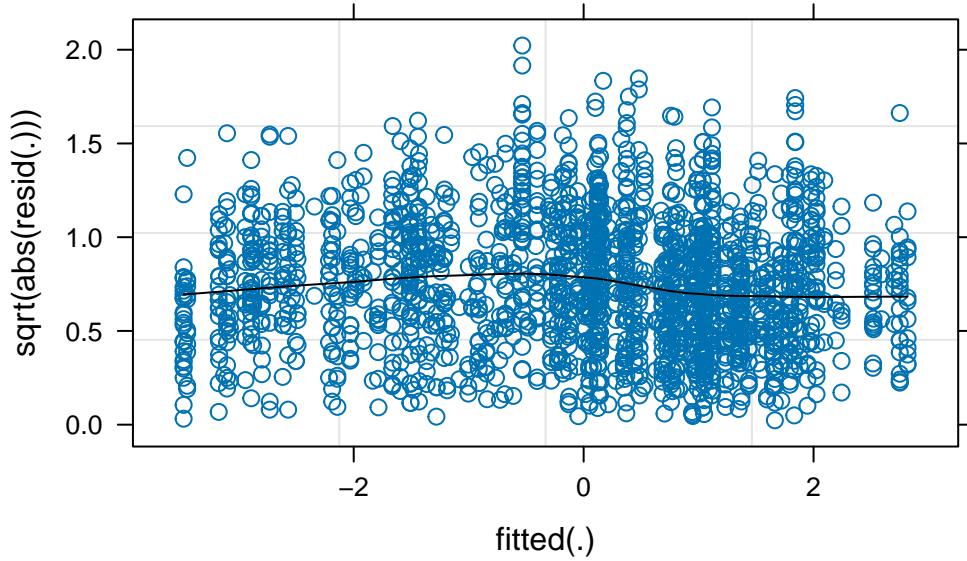

This chunk can be used to check the assumptions of all of the models computed above. In the following example, we examine the final model selected to predict Dim2 scores.

```
model2test <- md2

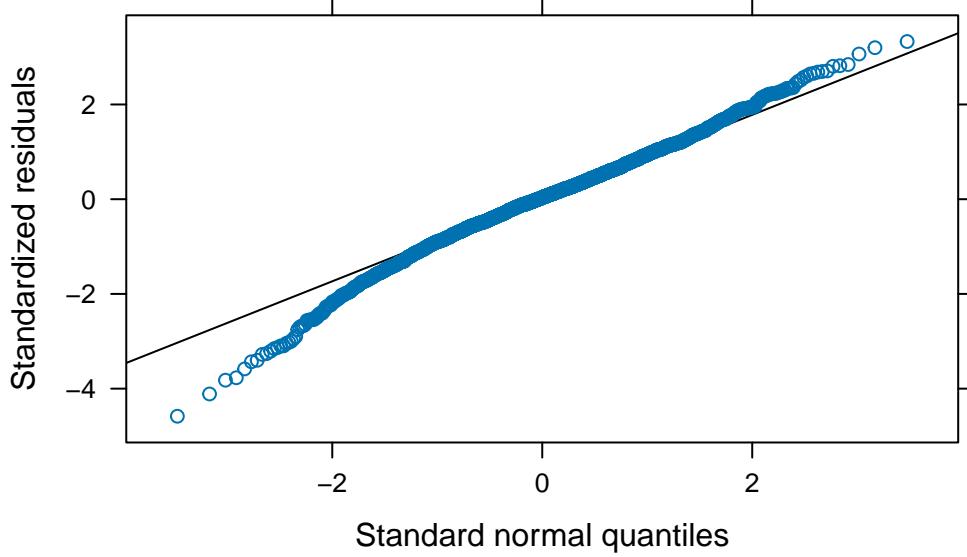

# check distribution of residuals
plot(model2test)
```

```
# scale-location plot
plot(model2test,
      sqrt(abs(resid(.)))~fitted(.),
      type=c("p","smooth"), col.line=1)
```

```
# Q-Q plot  
lattice::qqmath(model2test)
```

G Data Preparation for the Model of Textbook English vs. ‘real-world’ English

This script documents the steps taken to pre-process the data extracted from the Textbook English Corpus (TEC) and the three reference corpora that were ultimately entered in the comparative multi-dimensional model of Textbook English as compared to English outside the EFL classroom (Chapter 7).

G.1 Packages required

The following packages must be installed and loaded to process the data.

```
#renv::restore() # Restore the project's dependencies from the lockfile to
#                ensure that same package versions are used as in the original thesis.

library(broom.mixed) # For checking singularity issues
library(car) # For recoding data
library(corrplot) # For the feature correlation matrix
library(cowplot) # For nice plots
library(DT) # To display interactive HTML tables
library(emmeans) # Comparing group means of predicted values
library(GGally) # For ggpairs
library(gridExtra) # For making large faceted plots
library(here) # For ease of sharing
library(knitr) # Loaded to display the tables using the kable() function
library(lme4) # For mixed effects modelling
library(psych) # For various useful stats function, including KMO()
library(scales) # For working with colours
library(sjPlot) # For nice tabular display of regression models
library(tidyverse) # For data wrangling and plotting
library(visreg) # For nice visualisations of model results
select <- dplyr::select
filter <- dplyr::filter
```

G.2 Data import from MFTE outputs

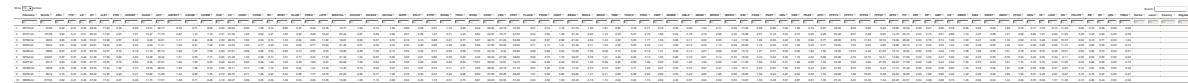

The raw data used in this script comes from the matrices of mixed normalised frequencies as output by the [MFTE Perl v. 3.1](#) (Le Foll 2021b).

G.2.1 Spoken BNC2014

```
SpokenBNC2014 <- read.delim(here("data", "MFTE",
  "SpokenBNC2014_3.1_normed_complex_counts.tsv"), header = TRUE,
  stringsAsFactors = TRUE)

SpokenBNC2014$Series <- "Spoken BNC2014"
SpokenBNC2014$Level <- "Ref."
SpokenBNC2014$Country <- "Spoken BNC2014"
SpokenBNC2014$Register <- "Spoken BNC2014"
```

These normalised frequencies were computed on the basis of my own “John and Jill in Ivybridge” version of the Spoken BNC2014 with added full stops at speaker turns (see Appendix B for details). This corpus comprises of 1,251 texts, all of which were used in the following analyses.

A screenshot of a Microsoft Excel spreadsheet. The spreadsheet contains a large grid of numerical data, likely representing the MFTE output for the Spoken BNC2014 corpus. The data is organized into rows and columns, with various columns labeled with codes such as 'ID', 'Series', 'Level', 'Country', 'Register', and numerous MFTE codes. The values within the cells are mostly small integers or zeros, indicating the frequency of specific linguistic features in each text sample.

G.2.2 Youth Fiction corpus

```
YouthFiction <- read.delim(here("data", "MFTE",
  "YF_sampled_500_3.1_normed_complex_counts.tsv"), header = TRUE,
  stringsAsFactors = TRUE)

YouthFiction$Series <- "Youth Fiction"
YouthFiction$Level <- "Ref."
YouthFiction$Country <- "Youth Fiction"
YouthFiction$Register <- "Youth Fiction"
```

These normalised frequencies were computed on the basis of the random samples of approximately 5,000 words of the books of the Youth Fiction corpus (for details of the works included in this corpus, see Appendix B). The sampling procedure is described in Section 4.3.2.4 of the book. This dataset consists of 1,191 files.

G.2.3 Informative Texts for Teens (InfoTeens) corpus

```
InfoTeen <- read.delim(here("data", "MFTE",
  "InfoTeen_3.1_normed_complex_counts.tsv"), header = TRUE,
  stringsAsFactors = TRUE)

# Removes three outlier files which should not have been included in the
# corpus as they contain exam papers only
InfoTeen <- InfoTeen |>
  filter(Filename!=".DS_Store" &
    Filename!="Revision_World_GCSE_10529068_wjec-level-law-past-papers.txt" &
    Filename!="Revision_World_GCSE_10528474_wjec-level-history-past-papers.txt" &
    Filename!="Revision_World_GCSE_10528472_edexcel-level-history-past-papers.txt")

InfoTeen$Series <- "Info Teens"
InfoTeen$Level <- "Ref."
InfoTeen$Country <- "Info Teens"
InfoTeen$Register <- "Info Teens"
```

Details of the composition of the Info Teens corpus can be found in Section 4.3.2.5 of the book. The version used in the present study comprises 1,411 texts.

G.3 Merging TEC and reference corpora data

G.3.1 Corpus size

These tables provide some summary statistics about the texts/files whose normalised feature frequencies were entered in the model of Textbook English vs. real-world English described in Chapter 7.

```
summary(ncounts$Subcorpus) |>  
  kable(col.names = c("(Sub)corpus", "# texts"),  
        format.args = list(big.mark = ","))
```

(Sub)corpus	# texts
Textbook Conversation	593
Textbook Fiction	285
Info Teens Ref.	1,411
Textbook Informative	364
Spoken BNC2014 Ref.	1,251
Youth Fiction Ref.	1,191

```
ncounts |>  
  group_by(Register) |>  
  summarise(totaltexts = n(),  
            totalwords = sum(Words),  
            mean = as.integer(mean(Words)),  
            sd = as.integer(sd(Words)),  
            TTRmean = mean(TTR)) |>  
  kable(digits = 2,  
        format.args = list(big.mark = ","),  
        col.names = c("Register", "# texts/files", "# words", "mean # words  
                    per text", "SD", "mean TTR"))
```

Register	# texts/files	# words	mean # words per text	SD	mean TTR
Conversation	1,844	13,804,196	7,486	8,690	0.40
Fiction	1,476	7,321,747	4,960	2,022	0.49
Informative	1,775	1,436,732	809	188	0.51

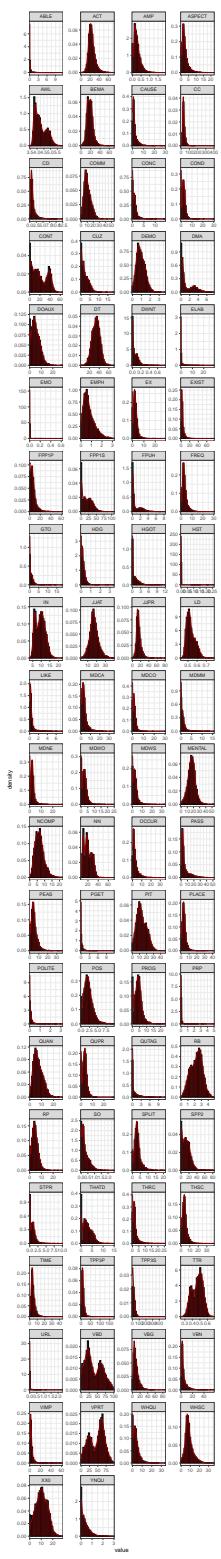

G.4 Data preparation for PCA

G.4.1 Feature distributions

The distributions of each linguistic features were examined by means of visualisation. As shown below, before transformation, many of the features displayed highly skewed distributions.

```
#ncounts <- readRDS(here("data", "processed", "counts3Reg.rds"))

ncounts |>
  select(-Words) |>
  keep(is.numeric) |>
  gather() |> # This function from tidyverse converts a selection of variables
  ↵   into two variables: a key and a value. The key contains the names of
  ↵   the original variable and the value the data. This means we can then
  ↵   use the facet_wrap function from ggplot2
  ggplot(aes(value, after_stat(density))) +
    theme_bw() +
    facet_wrap(~ key, scales = "free", ncol = 4) +
    scale_x_continuous(expand=c(0,0)) +
    scale_y_continuous(limits = c(0,NA)) +
    geom_histogram(bins = 30, colour= "black", fill = "grey") +
    geom_density(colour = "darkred", weight = 2, fill="darkred", alpha = .4)
```

```
#ggsave(here("plots", "DensityPlotsAllVariables.svg"), width = 15, height =
  ↵ 49)
```

G.4.2 Feature removal

A number of features were removed from the dataset as they are not linguistically interpretable. In the case of the TEC, this included the variable CD because numbers spelt out as digits were removed from the textbooks before these were tagged with the MFTE. In addition, the variables LIKE and SO because these are “bin” features included in the output of the MFTE to ensure that the counts for these polysemous words do not inflate other categories due to mistags (Le Foll 2021c).

Whenever linguistically meaningful, very low-frequency features, features with low MSA or communalities (see chunks below) were merged. Finally, features absent from more than third of texts were also excluded. For the comparative analysis of TEC and the reference corpora, the following linguistic features were excluded from the analysis due to low dispersion:

```
# Removal of meaningless feature: CD because numbers as digits were mostly
  ↵ removed from the textbooks, LIKE and SO because they are dustbin
  ↵ categories
ncounts <- ncounts |>
  select(-c(CD, LIKE, SO))

# Combine problematic features into meaningful groups whenever this makes
  ↵ linguistic sense
ncounts <- ncounts |>
  mutate(JJPR = JJPR + ABLE, ABLE = NULL) |>
  mutate(PASS = PGET + PASS, PGET = NULL) |>
  mutate(TPP3 = TPP3S + TPP3P, TPP3P = NULL, TPP3S = NULL) |> # Merged due to
  ↵ TPP3P having an individual MSA < 0.5
  mutate(FQTI = FREQ + TIME, FREQ = NULL, TIME = NULL) # Merged due to TIME
  ↵ communality < 0.2 (see below)

# Function to compute percentage of texts with occurrences meeting a
  ↵ condition
compute_percentage <- function(data, condition, threshold) {
  numeric_data <- Filter(is.numeric, data)
  percentage <- round(colSums(condition[, sapply(numeric_data,
  ↵ is.numeric)])/nrow(data) * 100, 2)
  percentage <- as.data.frame(percentage)
  colnames(percentage) <- "Percentage"
```

```

percentage <- percentage |>
  filter(!is.na(Percentage)) |>
  rownames_to_column() |>
  arrange(Percentage)
if (!missing(threshold)) {
  percentage <- percentage |>
    filter(Percentage > threshold)
}
return(percentage)
}

# Calculate percentage of texts with 0 occurrences of each feature
zero_features <- compute_percentage(ncounts, ncounts == 0, 66.6)
zero_features |>
  kable(col.names = c("Feature", "% texts with zero occurrences"))

```

Feature	% texts with zero occurrences
PRP	85.34
URL	93.03
EMO	98.98
HST	99.55

```

# Drop variables with low document frequency
ncounts2 <- select(ncounts, -one_of(zero_features$rowname))

```

These feature removal operations resulted in a feature set of 71 linguistic variables.

G.4.3 Identifying outlier texts

All normalised frequencies were normalised to identify any potential outlier texts.

```

# First scale the normalised counts (z-standardisation) to be able to compare
# the various features
zcounts <- ncounts2 |>
  select(-Words) |>
  keep(is.numeric) |>
  scale()

```

```

# If necessary, remove any outliers at this stage.
data <- cbind(ncounts2[,1:8], as.data.frame(zcounts))
outliers <- data |>
  filter(if_any(where(is.numeric) & !Words, .fns = function(x){x > 8})) |>
  select(Filename, Corpus, Register, Words)

```

The following outlier texts were identified according to the above conditions and excluded in subsequent analyses.

```

# These are potential outlier texts :
outliers |>
  kable(col.names = c("Filename", "Corpus", "Register", "# words"))

```

S5AA.txt	Spoken.BNC2014	Conversation	869

We check that that outlier texts are not particularly long or short texts by looking at the distribution of text/file length of the outliers.

```
summary(outliers$Words)
```

Min.	1st Qu.	Median	Mean	3rd Qu.	Max.
445.0	655.5	751.0	773.6	860.0	1869.0

```
hist(outliers$Words, breaks = 30)
```

We also check the distribution of outlier texts across the four corpora. The majority come from the Info Teens corpus, though quite a few are also from the TEC.

```
summary(outliers$Corpus) |>  
kable(col.names = c("(Sub)corpus", "# outlier texts"))
```

(Sub)corpus	# outlier texts
Textbook.English	40
Informative.Teens	74
Spoken.BNC2014	1
Youth.Fiction	0

```
# Report on the manual check of a sample of these outliers:  
  
# Encyclopedia_Kinds_au_10085347_Nobel_Prize_in_Chemistry.txt is essentially  
# a list of Nobel prize winners but with some additional information. In  
# other words, not a bad representative of the type of texts of the Info  
# Teen corpus.  
# Solutions_Elementary_ELF_Spoken_0013 --> Has a lot of "going to"  
# constructions because they are learnt in this chapter but is otherwise a  
# well-formed text.
```

```

# Teen_Kids_News_10403972_a-brief-history-of-white-house-weddings --> No
  ↳ issues
# Teen_Kids_News_10403301_golden-globe-winners-2019-the-complete-list -->
  ↳ Similar to the Nobel prize laureates text.
# Revision_World_GCSE_10528123_gender-written-textual-analysis-framework -->
  ↳ Text includes bullet points tokenised as the letter "o" but otherwise a
  ↳ fairly typical informative text.

# Removing the outliers at the request of the reviewers (but comparisons of
  ↳ models including the outliers showed that the results are very similar):
ncounts3 <- ncounts2 |>
  filter(!Filename %in% outliers$Filename)

#saveRDS(ncounts3, here("data", "processed", "ncounts3_3Reg.rds")) # Last
  ↳ saved 6 March 2024

```

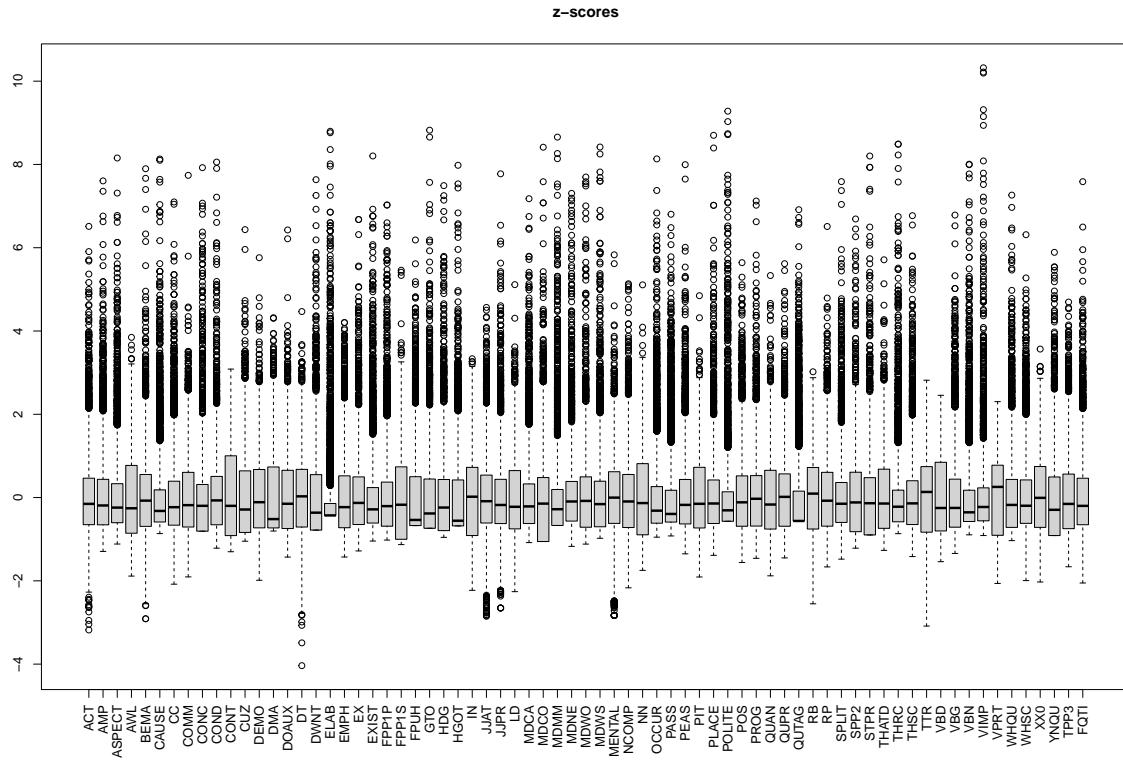

This resulted in 4,980 texts/files being included in the comparative model of Textbook English vs. ‘real-world’ English. These standardised feature frequencies were distributed as follows:

```

zcounts3 <- ncounts3 |>
  select(-Words) |>
  keep(is.numeric) |>
  scale()

boxplot(zcounts3, las = 3, main = "z-scores") # Slow

```

G.4.4 Signed log transformation

A signed logarithmic transformation was applied to (further) deskew the feature distributions (see Diwersy, Evert & Neumann 2014; Neumann & Evert 2021).

The signed log transformation function was inspired by the SignedLog function proposed in <https://cran.r-project.org/web/packages/DataVisualizations/DataVisualizations.pdf>.

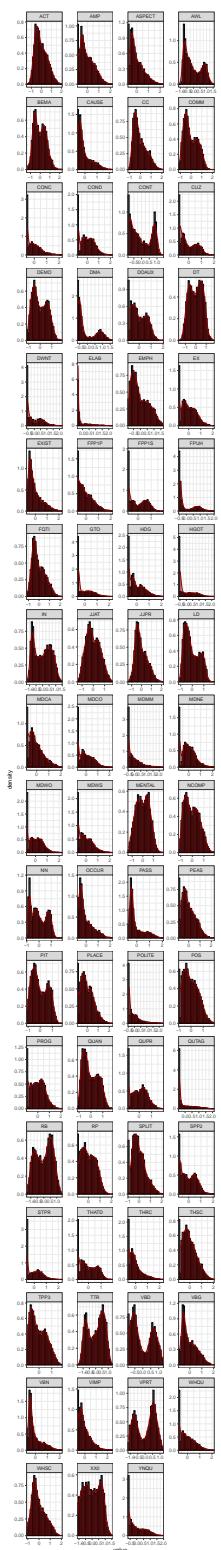

```
signed.log <- function(x) {sign(x)*log(abs(x)+1)}

# Standardise first, then sign log transform
zlogcounts <- signed.log(zcounts3)
```

The new feature distributions are visualised below.

```
zlogcounts |>
  as.data.frame() |>
  gather() |> # This function from tidyverse converts a selection of variables
  ↵ into two variables: a key and a value. The key contains the names of
  ↵ the original variable and the value the data. This means we can then
  ↵ use the facet_wrap function from ggplot2
```

```
ggplot(aes(value, after_stat(density))) +
  theme_bw() +
  facet_wrap(~ key, scales = "free", ncol = 4) +
  scale_x_continuous(expand=c(0,0)) +
  scale_y_continuous(limits = c(0,NA)) +
  geom_histogram(bins = 30, colour= "black", fill = "grey") +
  geom_density(colour = "darkred", weight = 2, fill="darkred", alpha = .4)
```

```
#ggsave(here("plots", "DensityPlotsAllVariablesSignedLog.svg"), width = 15,
  ↴ height = 49)
```

G.4.5 Merging of data for MDA

```
zlogcounts <- readRDS(here("data", "processed", "zlogcounts_3Reg.rds"))
#nrow(zlogcounts)
#colnames(zlogcounts)

ncounts3 <- readRDS(here("data", "processed", "ncounts3_3Reg.rds"))
#nrow(ncounts3)
#colnames(ncounts3)

data <- cbind(ncounts3[,1:8], as.data.frame(zlogcounts))
#saveRDS(data, here("data", "processed", "datazlogcounts_3Reg.rds")) # Last
  ↴ saved 16 March 2024
```

The final dataset comprises of 4,980 texts/files, divided as follows:

(Sub)corpus	# texts/files
Textbook Conversation	565
Textbook Fiction	285
Info Teens Ref.	1337
Textbook Informative	352
Spoken BNC2014 Ref.	1250
Youth Fiction Ref.	1191

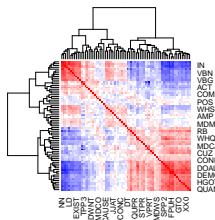

G.5 Testing factorability of data

G.5.1 Visualisation of feature correlations

We begin by visualising the correlations of the transformed feature frequencies using the `heatmap` function of the `stats` library. Negative correlations are rendered in blue; positive ones are in red.

```
# Simple heatmap in base R (inspired by Stephanie Evert's SIGIL code)
cor.colours <- c(
  hsv(h=2/3, v=1, s=(10:1)/10), # blue = negative correlation
  rgb(1,1,1), # white = no correlation
  hsv(h=0, v=1, s=(1:10/10))) # red = positive correlation

#png(here("plots", "heatmapzlogcounts.png"), width = 30, height= 30, units =
#  "cm", res = 300)
heatmap(cor(zlogcounts),
        symm=TRUE,
        zlim=c(-1,1),
        col=cor.colours,
        margins=c(7,7))
```

```
#dev.off()
```

G.5.2 Collinearity

As a result of the normalisation unit of finite verb phrases for verb-based features, the present tense (VPRT) and past tense (VBD) variables are correlated to a very high degree:

```
cor(data$VPRT, data$VBD) |> round(2)
```

```
[1] -0.97
```

We therefore remove the least marked of the pair of collinear variables: VPRT.

```
data <- data |>
  select(-c(VPRT))
```

G.5.3 MSA

```
kmo <- KMO(data[,9:ncol(data)]) # The first eight columns contain metadata.
```

The overall MSA value of the dataset is 0.95. The features have the following individual MSA values (ordered from lowest to largest):

```
kmo$MSAi [order(kmo$MSAi)] |> round(2)
```

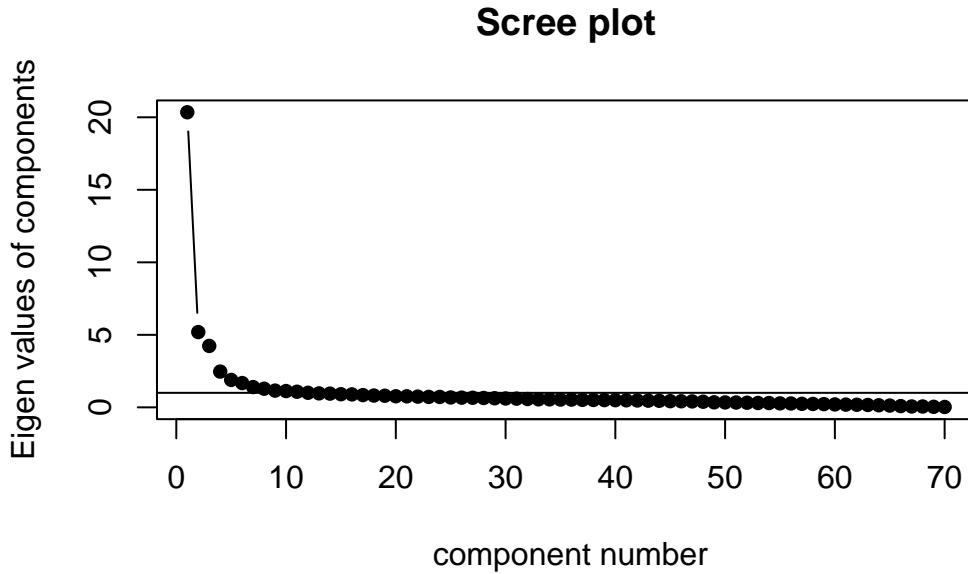

AMP	COMM	POS	TPP3	JJPR	PLACE	SPLIT	DT	JJAT	VIMP	MDC0

0.95	0.95	0.95	0.95	0.95	0.96	0.96	0.96	0.96	0.96	0.96
VBG	AWL	POLITE	PASS	PIT	DOAUX	ELAB	ASPECT	DMA	DEMO	HDG
0.96	0.96	0.96	0.96	0.97	0.97	0.97	0.97	0.97	0.97	0.97
IN	FPUH	OCCUR	CUZ	EMPH	YNQU	QUAN	TTR	QUTAG	THATD	VBN
0.97	0.97	0.97	0.97	0.98	0.98	0.98	0.98	0.98	0.98	0.98
EXIST	STPR	GTO	HGOT							
0.98	0.99	0.99	0.99							

We aim to remove features with an individual MSA < 0.5. All features have individual MSAs of > 0.5 (but only because TPP3P was merged into a broader category in an earlier chunk).

G.5.4 Scree plot

Six components were originally retained on the basis of the following screeplot, though only the first four were found to be interpretable and were therefore included in the model.

```
# png(here("plots", "screeplot-TEC-Ref_3Reg.png"), width = 20, height= 12,
  ↴ units = "cm", res = 300)
scree(data[,9:ncol(data)], factors = FALSE, pc = TRUE) #
```

```
# dev.off()

# Perform PCA
pca1 <- psych::principal(data[9:ncol(data)],
                           nfactors = 6)
```

G.5.5 Communalities

If features with final communalities of < 0.2 are removed, TIME would have to be removed. TIME was therefore merged with FREQ in an earlier chunk so that now all features have final communalities of > 0.2 (note that this is a very generous threshold!).

```
pca1$communality |> sort() |> round(2)
```

The final dataset entered in the analysis described in Chapter 7 therefore comprises 4,980 texts/files, each with logged standardised normalised frequencies for 70 linguistic features.

H Data Analysis for the Model of Textbook English vs. ‘real-world’ English

This script documents the analysis of data from the TEC and reference corpus data (as pre-processed in Appendix F) to arrive at the multi-dimensional model of Textbook Englisch vs. ‘real-world’ English described in Chapter 7. It generates all of the statistics and plots included in the book, as well as many others that were used in the analysis, but were not included in the book for reasons of space.

H.1 Packages required

The following packages must be installed and loaded to process the data.

```
#renv::restore() # Restore the project's dependencies from the lockfile to
  ↳ ensure that same package versions are used as in the original thesis.

library(caret) # For its confusion matrix function
library(cowplot) # For its plot themes
library(DescTools) # For 95% CI
library(emmeans) # For the emmeans function
library(factoextra) # For circular graphs of variables
library(gtsummary) # For nice table of summary statistics (optional)
library(gridExtra) # For Fig. 35
library(here) # For dynamic file paths
library(ggthemes) # For theme of factoextra plots
library(knitr) # Loaded to display the tables using the kable() function
library(lme4) # For linear regression modelling
library(patchwork) # To create figures with more than one plot
#library(pca3d) # For 3-D plots (not rendered in exports)
library(PCAtools) # For nice biplots of PCA results
library(psych) # For various useful stats function
library(sjPlot) # For model plots and tables
library(tidyverse) # For data wrangling
library(visreg) # For plots of interaction effects
```

```
source(here("R_rainclouds.R")) # For geom_flat_violin rainplots
```

H.2 Conducting the PCA

We first import the full dataset (see Appendix F for data preparation steps).

The following chunks can be used to perform the MDA on various subsets of the data (see also Section 10.1.1 in the book).

- i. Subset of the data that excludes the lower-level textbooks:

```
data <- readRDS(here("processed_data", "dataforPCA.rds")) |>  
  filter(Level != "A" & Level != "B") |>  
  droplevels()  
summary(data$Level)
```

- i. Subset of the data that includes only one **Country**‘ subcorpus of the TEC (note that a detailed analysis of the German subcorpus can be found in (Le Foll)):

```
data <- readRDS(here("processed_data", "dataforPCA.rds")) |>  
#filter(Country != "France" & Country != "Germany") |> # Spain only  
#filter(Country != "France" & Country != "Spain") |> # Germany only  
filter(Country != "Spain" & Country != "Germany") |> # France only  
droplevels()  
summary(data$Country)
```

- i. Random subsets of the data to test the stability of the model proposed in Chapter 7. Re-running this line will generate a new subset of 2/3 of the texts randomly sampled. `set.seed(13)` was used for the analyses reported on in Section 10.1.1.

```
set.seed(13)  
data <- readRDS(here("processed_data", "dataforPCA.rds")) |>  
  slice_sample(n = 4980*0.6, replace = FALSE)  
nrow(data)  
data$Filename[1:4]  
#Using the set.seed(13), these should be:  
#[1] HT_4_Spoken_0009.txt  
#[2] Solutions_Intermediate_Plus_Spoken_0020.txt  
#[3] 141_PRATCHETT1992DW13GODS_4.txt  
#[4] Achievers_B2_Informative_0004.txt
```

H.3 Plotting PCA results

H.3.1 3D plots

The following chunk can be used to create projections of TEC texts on three dimensions of the model. These plots cannot be rendered in two dimensions and are therefore not generated in the present document. For more information on the `pca3d` library, see: <https://cran.r-project.org/web/packages/pca3d/vignettes/pca3d.pdf>.

```
# Data preparation for 3D plots
colnames(data) # Checking that the features start at the 9th column
pca <- prcomp(data[,9:ncol(data)], scale.=FALSE) # All quantitative variables
# that contribute to the model
register <- factor(data[,"Register"])
corpus <- factor(data[,"Corpus"])
subcorpus <- factor(data[,"Subcorpus"])

library(pca3d)

pca3d(pca, group = subcorpus,
       components = 1:3,
       components = 4:6,
       show.plane=FALSE,
       col = col6,
       shape = shapes6,
       radius = 0.7,
       legend = "right")

snapshotPCA3d(here("plots", "PCA_TxB_3Ref_3Dsnapshot.png"))

# Alternative visualisation, looking at all three Textbook English registers
# in one colour

pca3d(pca, group = corpus,
       show.plane=FALSE,
       components = 1:3,
       col = col4,
       shape = shapes4,
       radius = 0.7,
       legend = "right")
```

H.4 Two-dimensional plots (biplots)

These plots were generated using the `PCAtools` package, which requires the data to be formatted in a rather unconventional way so it needs to wrangled first.

H.4.1 Data wrangling for PCAtools

```
# Data wrangling
data2 <- data |>
  mutate(Source = recode_factor(Corpus, Textbook.English = "Textbook English
    ↵ (TEC)", Informative.Teens = "Reference corpora", Spoken.BNC2014 =
    ↵ "Reference corpora", Youth.Fiction = "Reference corpora")) |>
  mutate(Corpus = fct_relevel(Subcorpus, "Info Teens Ref.", after = 9)) |>
  relocate(Source, .after = "Corpus") |>
  droplevels()

# colnames(data2)
data2meta <- data2[,1:9]
rownames(data2meta) <- data2meta$Filename
data2meta <- data2meta |> select(-Filename)
# head(data2meta)
rownames(data2) <- data2$Filename
data2num <- as.data.frame(base::t(data2[,10:ncol(data2)]))
# data2num[1:5,1:5] # Check data frame format is correct by comparing to
  ↵ output of head(data2meta) above

p <- PCAtools::pca(data2num,
  metadata = data2meta,
  scale = FALSE)
```

The cumulative proportion of variance in the dataset explained the first four components explain 47.15%.

H.4.2 Pairs plot

This chunk produces a scatterplot matrix of combinations of the four dimensions of the model of Textbook English vs. ‘real-world’ English. Note that the number before the comma on each axis label shows which principal component is plotted on that axis; this is followed by the percentage of the total variance explained by that particular component. The colours correspond to the text registers.

```

# For five TEC registers
# colkey = c(`Spoken BNC2014 Ref.`="#BD241E", `Info Teens Ref.`="#15274D",
#   `Youth Fiction Ref.`="#267226", `Textbook Fiction`="#A18A33", `Textbook
#   Conversation`="#F9B921", `Textbook Informative` = "#722672", `Textbook
#   Instructional` = "grey", `Textbook Personal` = "black")

# For three TEC registers
# summary(data2$Corpus)
colkey = c(`Spoken BNC2014 Ref.`="#BD241E", `Info Teens Ref.`="#15274D",
  `Youth Fiction Ref.`="#267226", `Textbook Fiction`="#A18A33", `Textbook
  Conversation`="#F9B921", `Textbook Informative` = "#722672")

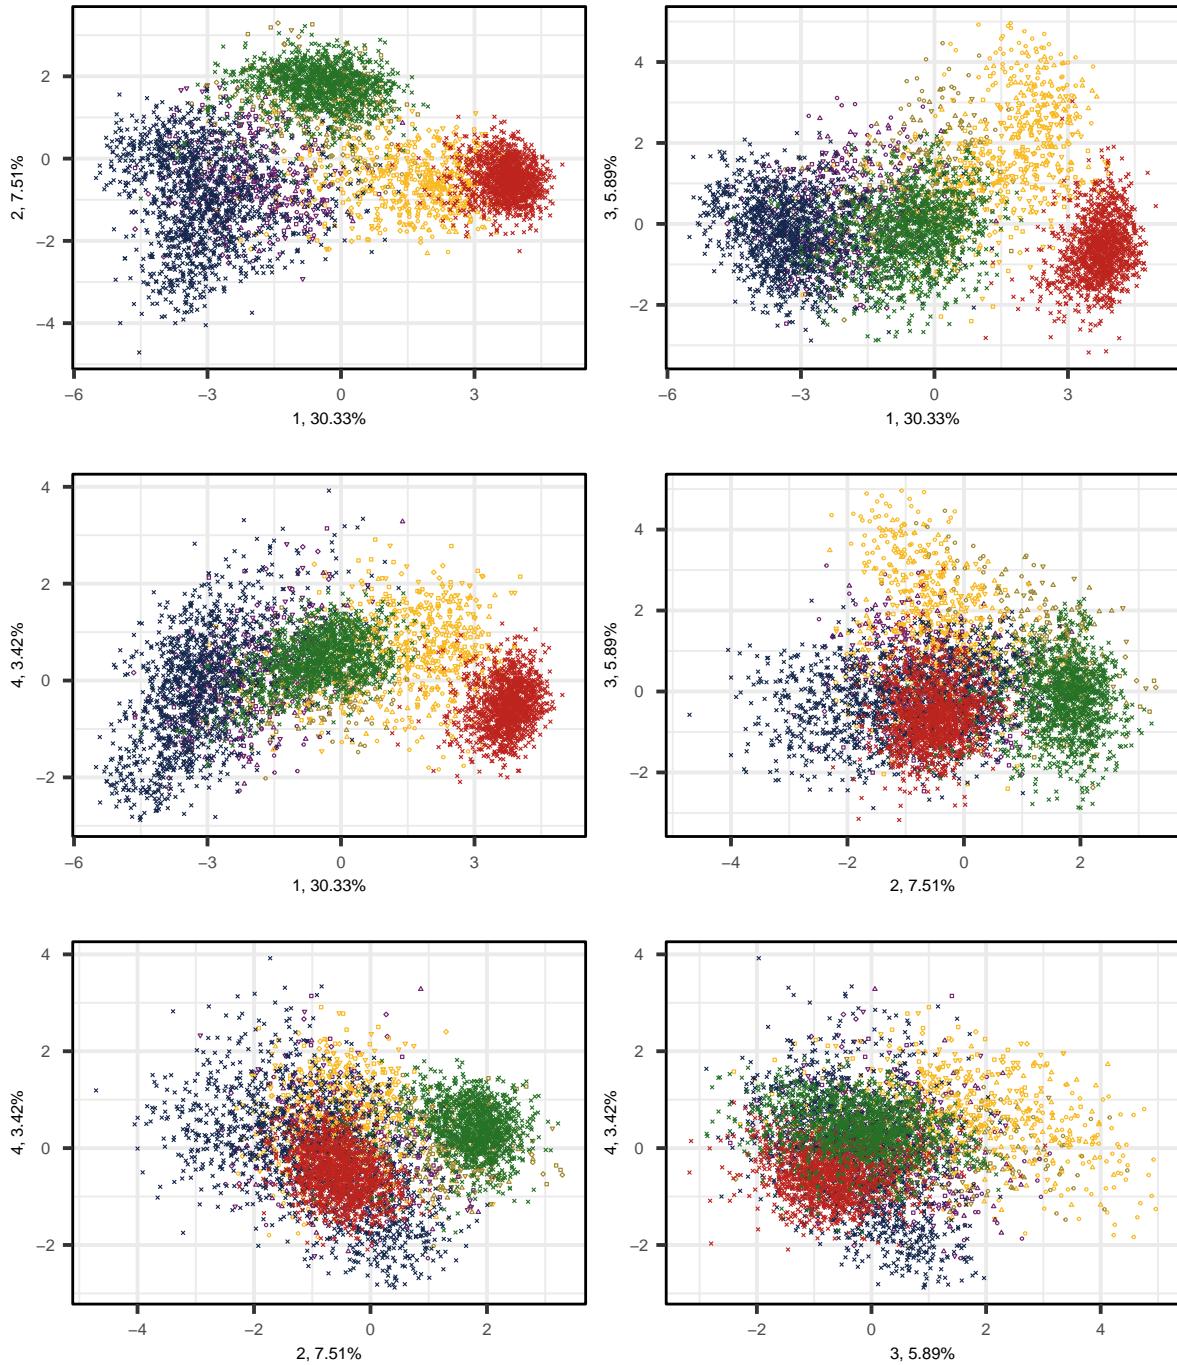

#summary(data2$Source)
#shapekey = c(`Textbook English (TEC)`=6, `Reference corpora`=1)

# summary(data2$Level)
shapekey = c(A=1, B=2, C=6, D=0, E=5, `Ref.`=4)

## Warning: this can be very slow! Open in extra zoomed out window!

#png(here("plots", "PCA_3Ref_pairsplot.png"), width = 12, height= 19, units =
#  "cm", res = 300)
PCAtools::pairsplot(p,
  triangle = FALSE,
  components = 1:4,
  ncol = 2,
  nrow = 3,
  pointSize = 0.6,
  shape = "Level",
  shapekey = shapekey,
  lab = NULL, # Otherwise will try to label each data point!
  colby = "Corpus",
  legendPosition = "none",
  margingaps = unit(c(0.2, 0.2, 0.8, 0.2), "cm"),
  colkey = colkey)

```

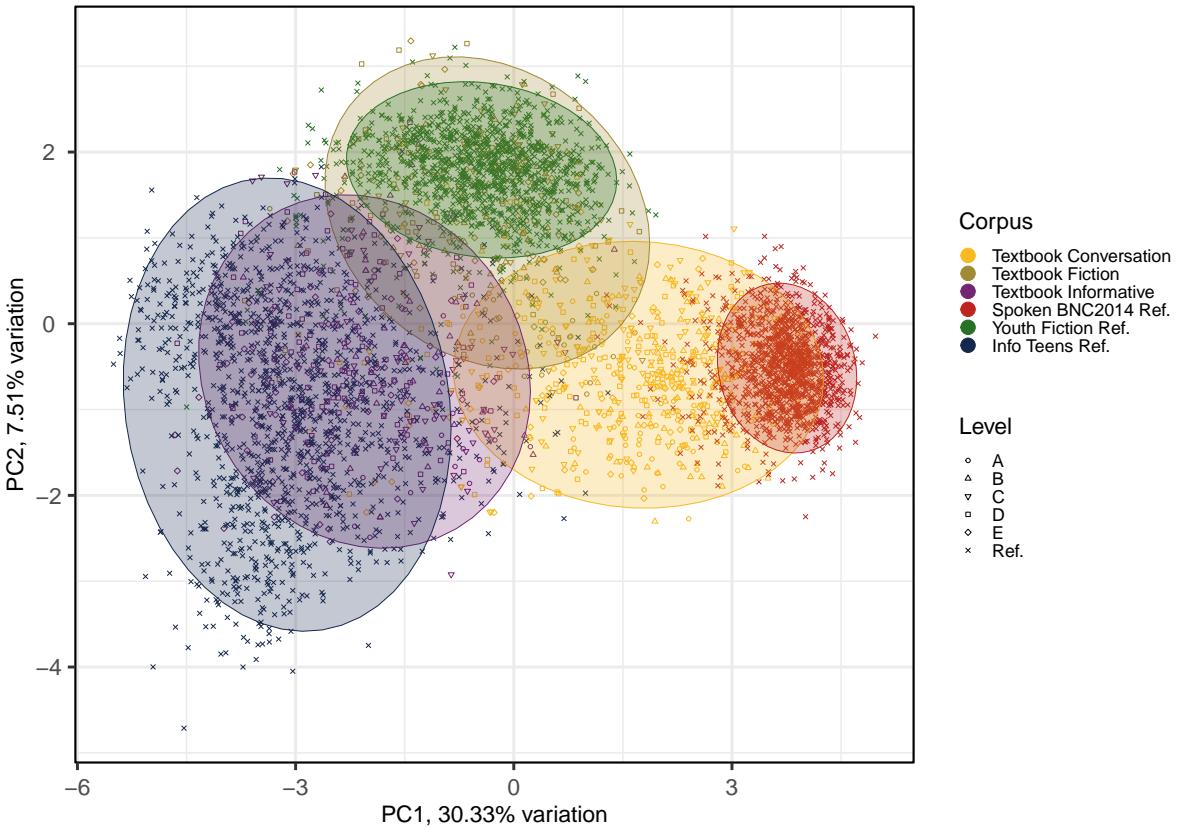

```
#dev.off()
#ggsave(here("plots", "PCA_TxB_pairsplot.svg"), width = 6, height = 10)
# Note that the legend has to be added manually (it was taken from the biplot
# code below).
```

H.4.3 Bi-plots

Biplots are used to more closely examine the position of texts on just two dimensions.

```
# These settings (with legendPosition = "top") were used to generate the
# legend for the scatterplot matrix above:
#png(here("plots", "PCA_3Ref_Biplot_PC1_PC2test.png"), width = 40, height =
# 25, units = "cm", res = 300)

PCAtools::biplot(p,
  x = "PC1",
  y = "PC2",
  lab = NULL, # Otherwise will try to label each data point!
  colby = "Corpus",
  pointSize = 1.3,
  colkey = colkey,
  shape = "Level",
  shapekey = shapekey,
  xlim = c(min(p$rotated[, "PC1"]), max(p$rotated[, "PC1"])),
  ylim = c(min(p$rotated[, "PC2"]), max(p$rotated[, "PC2"])),
  showLoadings = FALSE,
  ellipse = TRUE,
  axisLabSize = 18,
  legendPosition = 'right',
  legendTitleSize = 18,
  legendLabSize = 14,
  legendIconSize = 5) +
  theme(plot.margin = unit(c(0,0,0,0.2), "cm"))
```

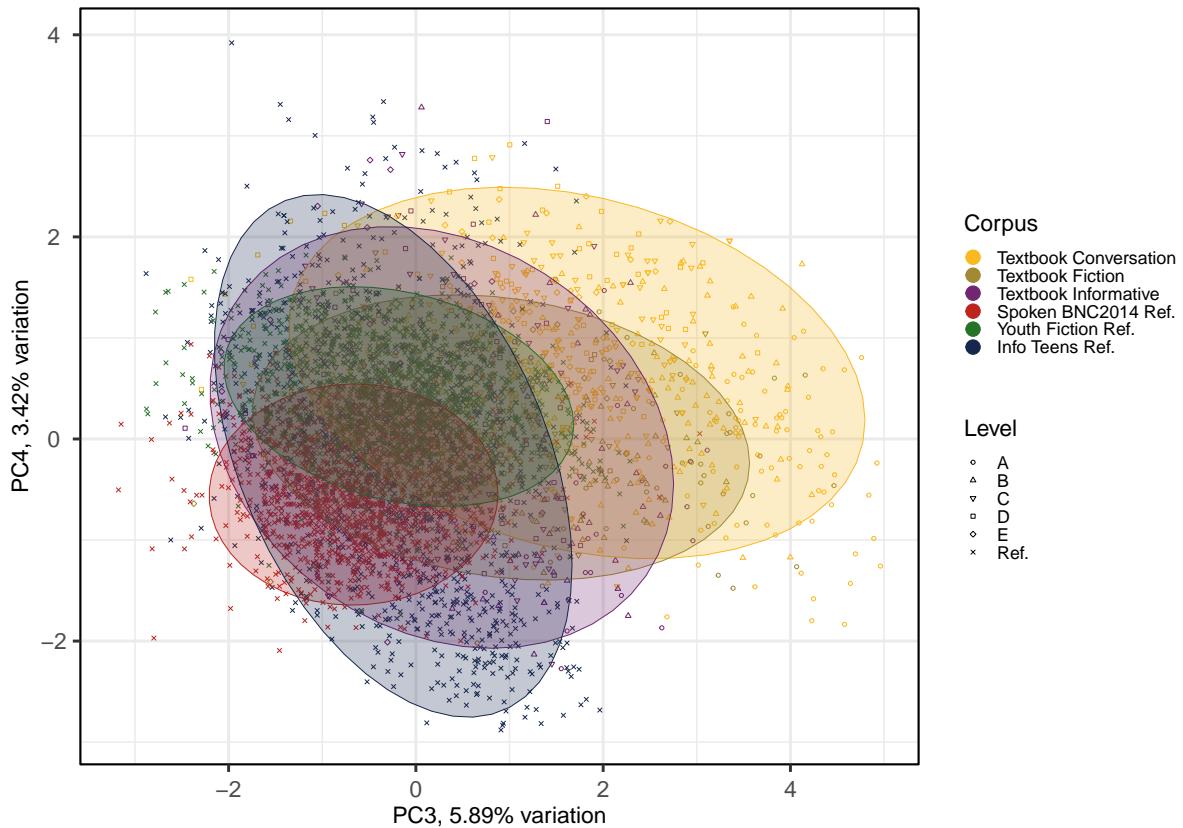

```
#ggsave(here("plots", "PCA_Ref3TxB_BiplotPC1_PC2.svg"), width = 12, height =
  8)

# Biplots to examine components more carefully
PCAtools::biplot(p,
  x = "PC3",
  y = "PC4",
  lab = NULL, # Otherwise will try to label each data point!
  colby = "Corpus",
  pointSize = 1.2,
  colkey = colkey,
  shape = "Level",
  shapekey = shapekey,
  xlim = c(min(p$rotated[, "PC3"]), max(p$rotated[, "PC3"])),
  ylim = c(min(p$rotated[, "PC4"]), max(p$rotated[, "PC4"])),
  showLoadings = FALSE,
```

```

ellipse = TRUE,
axisLabSize = 18,
legendPosition = 'right',
legendTitleSize = 18,
legendLabSize = 14,
legendIconSize = 5) +
theme(plot.margin = unit(c(0,0,0,0.2), "cm"))

```

```
#ggsave(here("plots", "PCA_Ref3TxB_BiplotPC3_PC4.svg"), width = 12, height =
  8)
```

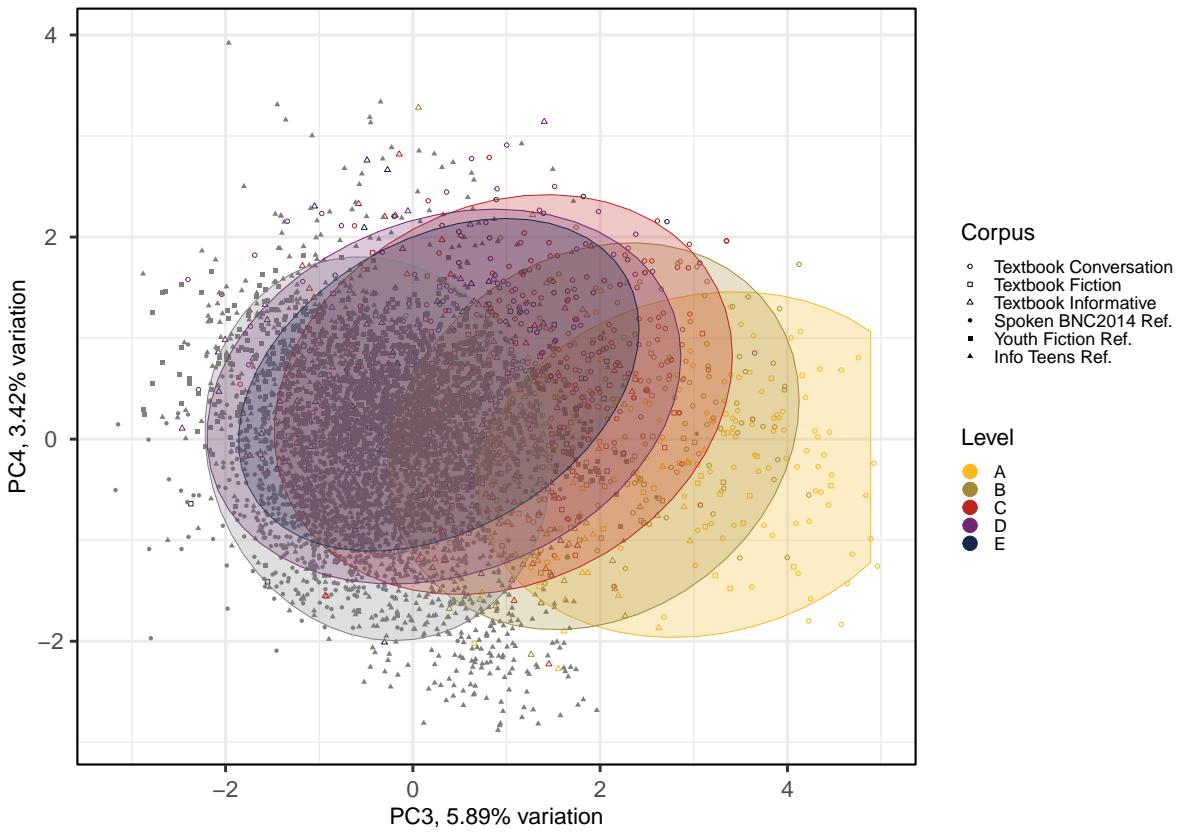

The colours and corresponding ellipses can be used to visualise different clusters and patterns. In the following, we change the colour of the points and the ellipses to represent the texts' target proficiency levels instead of the register, allowing for a different interpretation of the model.

```

# Biplot with ellipses for Level rather than Register
colkeyLevels = c(A="#F9B921", B="#A18A33", C="#BD241E", D="#722672",
                 E="#15274D", `Ref. data` = "darkgrey")
shapekeyLevels = c(`Spoken BNC2014 Ref.`=16, `Info Teens Ref.`=17, `Youth
                   Fiction Ref.`=15, `Textbook Fiction`=0, `Textbook Conversation`=1,
                   `Textbook Informative`=2)

PCAtools::biplot(p,
                  x = "PC3",
                  y = "PC4",
                  lab = NULL, # Otherwise will try to label each data point!
                  colby = "Level",
                  pointSize = 1.3,
                  colkey = colkeyLevels,
                  shape = "Corpus",
                  shapekey = shapekeyLevels,
                  xlim = c(min(p$rotated[, "PC3"]), max(p$rotated[, "PC3"])),
                  ylim = c(min(p$rotated[, "PC4"]), max(p$rotated[, "PC4"])),
                  showLoadings = FALSE,
                  ellipse = TRUE,
                  axisLabSize = 18,
                  legendPosition = 'right',
                  legendTitleSize = 18,
                  legendLabSize = 14,
                  legendIconSize = 5) +
theme(plot.margin = unit(c(0,0,0,0.2), "cm"))

```

```
#ggsave(here("plots", "PCA_Ref3Tx_BiplotPC3_PC4_levels.svg"), width = 12,
        height = 8)
```

H.5 Feature contributions (loadings) on each component

```
#data <- readRDS(here("processed_data", "dataforPCA.rds"))
pca <- prcomp(data[,9:ncol(data)], scale.=FALSE) # All quantitative variables
# to be included in the model

# The rotated data that represents the observations / samples is stored in
# rotated, while the variable loadings are stored in loadings
loadings <- as.data.frame(pca$rotation[,1:4])
```

```
# Table of loadings with no minimum threshold applied
loadings |>
  round(2) |>
  kable()
```

H.6 Graphs of features of that contribute most to each component/dimension

Graphs of features display the features with the strongest contributions to any two dimensions of the model of intra-textbook variation. They are created using the `factoextra::fviz_pca_var` function.

```
factoextra::fviz_pca_var(pca,
  axes = c(1,2),
  select.var = list(contrib = 25),
  col.var = "contrib", # Colour by contributions to the PC
  gradient.cols = c("#F9B921", "#DB241E", "#722672"),
  title = "",
  repel = TRUE, # Try to avoid too much text overlapping
  ggtheme = ggthemes::theme_few())
```

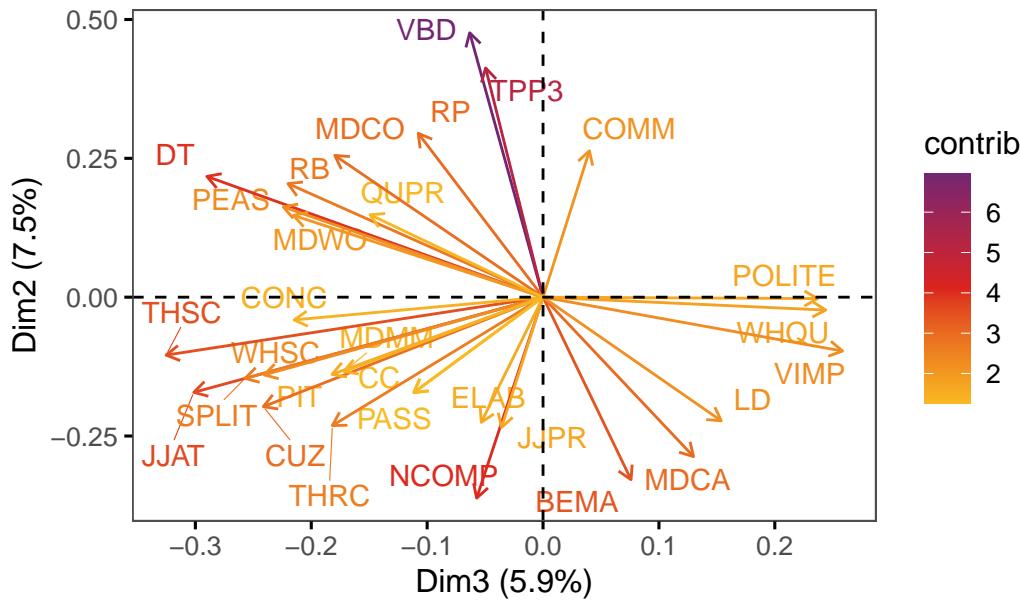

```
#ggsave(here("plots", "fviz_pca_var_PC1_PC2_Ref3Reg.svg"), width = 9, height
        = 7)

factoextra::fviz_pca_var(pca,
  axes = c(3,2),
```

```

select.var = list(contrib = 30),
col.var = "contrib", # Colour by contributions to the PC
gradient.cols = c("#F9B921", "#DB241E", "#722672"),
title = "",
repel = TRUE, # Try to avoid too much text overlapping
ggtheme = ggthemes::theme_few()

```

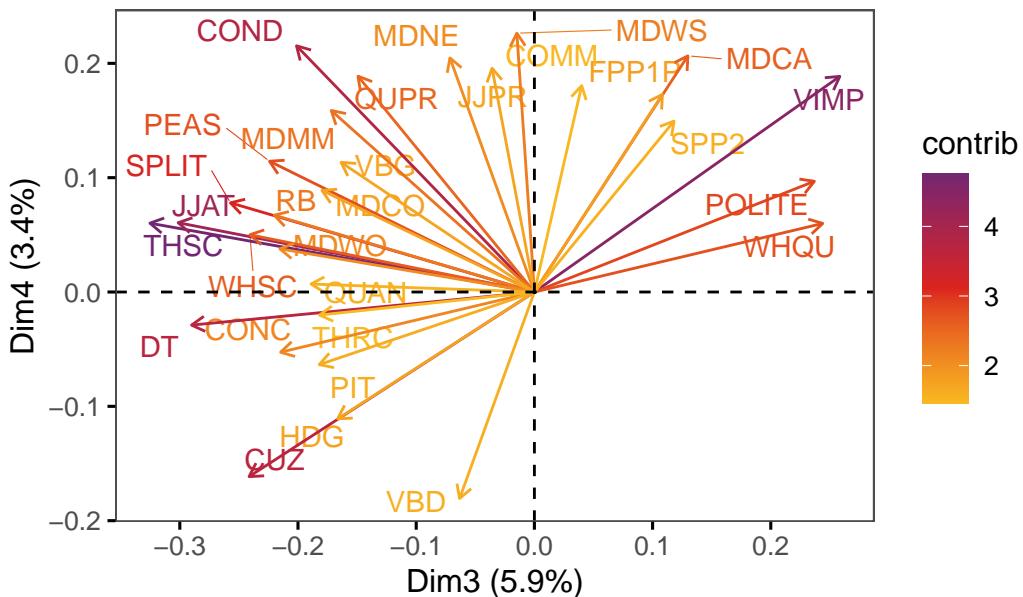

```

#ggsave(here("plots", "fviz_pca_var_PC3_PC2_Ref3Reg.svg"), width = 9, height
#      = 8)

factoextra::fviz_pca_var(pca,
  axes = c(3,4),
  select.var = list(contrib = 30),
  col.var = "contrib", # Colour by contributions to the PC
  gradient.cols = c("#F9B921", "#DB241E", "#722672"),
  title = "",
  repel = TRUE, # Try to avoid too much text overlapping
  ggtheme = ggthemes::theme_few())

```

```
#ggsave(here("plots", "fviz_pca_var_PC3_PC4_Ref3Reg.svg"), width = 9, height
       = 8)
```

H.7 Exploring feature contributions in terms of normalised frequencies

We can go back to the normalised frequencies of the individual features to compare them across different registers and levels, e.g.,:

```
ncounts <- readRDS(here("data", "processed", "ncounts3_3Reg.rds"))

ncounts |>
  filter(Register=="Informative") |>
  #filter(Level %in% c("C", "D", "E")) |>
  select(Level, VBD, PEAS) |>
  group_by(Level) |>
  summarise_if(is.numeric, mean) |>
  kable(digits=2)
```

Level	VBD	PEAS
A	28.11	0.21
B	34.11	2.49
C	35.21	5.36
D	39.83	7.63
E	35.17	6.91
Ref.	39.73	4.94

The following chunk produces Figure 35 which shows normalised counts of selected features with salient loadings on PC1 in the Textbook Informative subcorpus (Levels A to E) and the reference Info Teens corpus (Ref.). This plots visualises the observed normalised frequencies as they were extracted using the MFTE Perl (see Appendices C and F).

```

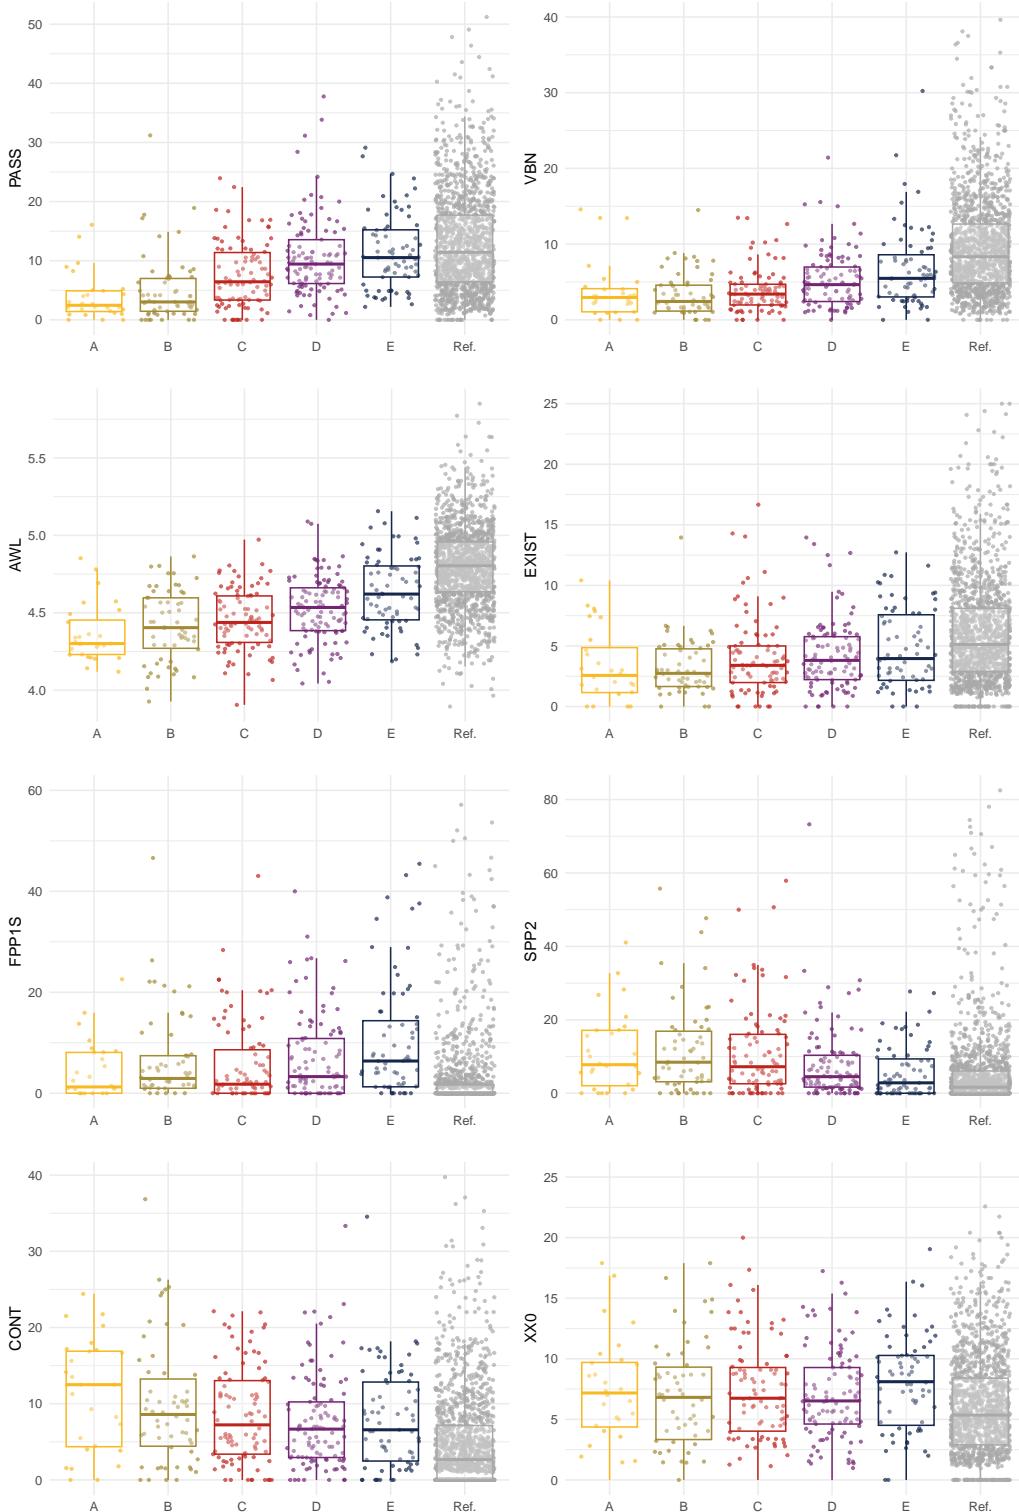

cols = c("#F9B921", "#A18A33", "#BD241E", "#722672", "#15274D", "darkgrey")

boxfeature <- ncounts |>
  filter(Register=="Informative") |>
  #filter(Level %in% c("C", "D", "E")) |>
  select(Level, FPP1S, SPP2, CONT, EXIST, AWL, XX0, PASS, VBN) |>
  ggplot(aes(x = Level, y = CONT, colour = Level, fill = Level)) +
  geom_jitter(size=0.7, alpha=.7) +
  geom_boxplot(outlier.shape = NA, fatten = 2, fill = "white", alpha = 0.3) +
  scale_colour_manual(values = cols) +
  theme_minimal() +
  theme(legend.position = "none") +
  xlab("")

CONT = boxfeature
SPP2 <- boxfeature + aes(y = SPP2)
EXIST <- boxfeature + aes(y = EXIST) + ylim(c(0,25)) # These y-axis limits
  ↳ remove individual outliers that overextend the scales and make the
  ↳ existing differences invisible to the naked eye. They can be removed to
  ↳ visualise all data points.
FFP1 <- boxfeature + aes(y = FPP1S) + ylim(c(0,60))
AWL <- boxfeature + aes(y = AWL)
XX0 <- boxfeature + aes(y = XX0) + ylim(c(0,25))
PASS <- boxfeature + aes(y = PASS)
VBN <- boxfeature + aes(y = VBN) + ylim(c(0,40))

boxplots <- gridExtra::grid.arrange(PASS, VBN, AWL, EXIST, FFP1, SPP2, CONT,
  ↳ XX0, ncol=2, nrow=4)

```

```
#ggsave(here("plots", "BoxplotsInformativeFeatures.svg"), plot = boxplots,
  ↴ dpi = 300, width = 9, height = 11)
```

H.8 Exploring the dimensions of the model

We begin with some descriptive statistics of the dimension scores.

```
#data <- readRDS(here("data", "processed", "dataforPCA.rds"))
#colnames(data)
pca <- prcomp(data[,9:ncol(data)], scale.=FALSE) # All quantitative variables

## Access to the PCA results
#colnames(data)
res.ind <- cbind(data[,1:8], as.data.frame(pca$x)[,1:4])

## Summary statistics
res.ind |>
  group_by(Subcorpus, Level) |>
  summarise_if(is.numeric, c(mean = mean, sd = sd)) |>
  kable(digits = 2)
```

```

H.10 Computing mixed-effects models of the dimension scores

H.10.1 Data preparation

In this chunk, we add a `Source` variable to be used as a random effect variable in the following mixed-effects models (see 5.3.8 for details).

```
res.ind <- res.ind |>
  mutate(Source = case_when(
    Corpus=="Youth.Fiction" ~ paste("Book", str_extract(Filename,
      "[0-9]{1,3}"), sep = ""),
    Corpus=="Spoken.BNC2014" ~ "Spoken.BNC2014",
    Corpus=="Textbook.English" ~ as.character(Series),
    Corpus=="Informative.Teens" ~ str_extract(Filename, "BBC|Science_Tech"),
    TRUE ~ "NA")) |>
  mutate(Source = case_when(
    Corpus=="Informative.Teens" & is.na(Source) ~ str_remove(Filename, "_.*"),
    TRUE ~ as.character(Source))) |>
  mutate(Source = as.factor(Source)) |>
  mutate(Corpus = case_when(
    Corpus=="Textbook.English" ~ "Textbook",
    Corpus=="Informative.Teens" ~ "Reference",
    Corpus=="Spoken.BNC2014" ~ "Reference",
    Corpus=="Youth.Fiction" ~ "Reference"
  )) |>
  mutate(Corpus = as.factor(Corpus))

# Change the reference levels to theoretically more meaningful levels and one
# that is better populated (see, e.g.,
# https://stats.stackexchange.com/questions/430770/in-a-multilevel-linear-regression-how-do
# summary(res.ind$Corpus)
res.ind$Corpus <- relevel(res.ind$Corpus, "Reference")

# summary(res.ind$Subcorpus)
res.ind$Subcorpus <- factor(res.ind$Subcorpus, levels = c("Spoken BNC2014
# Ref.", "Textbook Conversation", "Youth Fiction Ref.", "Textbook Fiction",
# Info Teens Ref.", "Textbook Informative"))
```

```
# summary(res.ind$Level)
res.ind$Level <- relevel(res.ind$Level, "Ref.")
```

H.10.2 Dimension 1: 'Spontaneous interactional vs. Edited informational'

We first compare various models and then present a tabular summary of the best-fitting one.

```
md_source <- lmer(PC1 ~ 1 + (Register|Source), res.ind, REML = FALSE)
md_corpus <- update(md_source, .~. + Level) # Failed to converge
md_register <- update(md_source, . ~ . + Register)
md_both <- update(md_corpus, .~. + Register)
md_interaction <- update(md_both, . ~ . + Level:Register)

anova(md_source, md_corpus, md_register, md_both, md_interaction)
```

```
Data: res.ind
Models:
  md_source: PC1 ~ 1 + (Register | Source)
  md_register: PC1 ~ (Register | Source) + Register
  md_corpus: PC1 ~ (Register | Source) + Level
  md_both: PC1 ~ (Register | Source) + Level + Register
  md_interaction: PC1 ~ (Register | Source) + Level + Register + Level:Register

```

```
md_interaction <- lmer(PC1 ~ Level + Register + Level*Register +
  ~ (Register|Source), res.ind, REML = FALSE)

tab_model(md_interaction, wrap.labels = 200) # R2 = 0.870 / 0.923
```

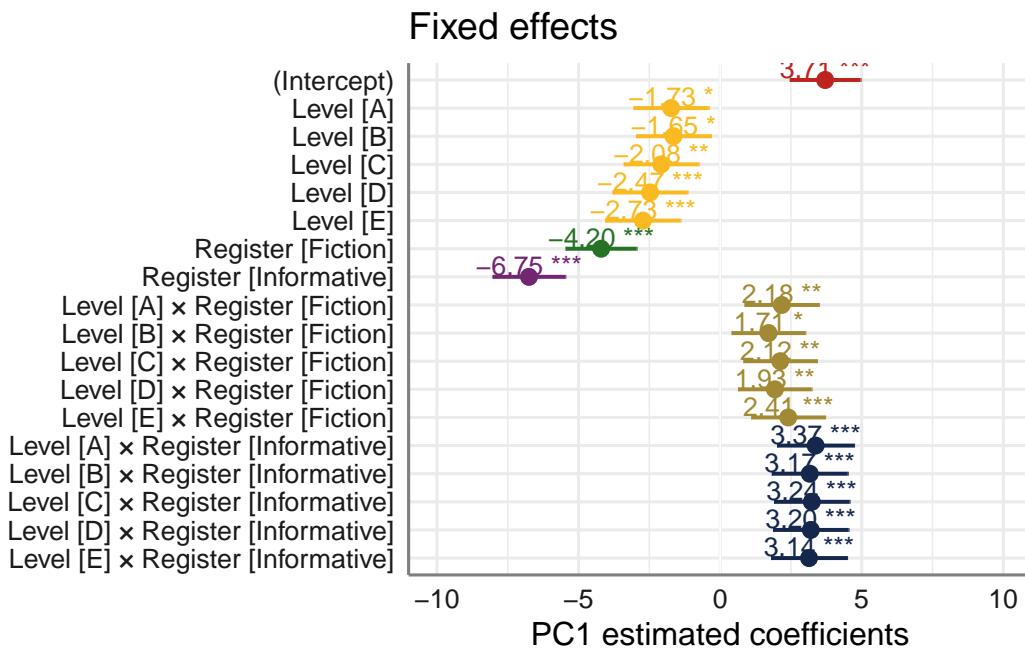

Its estimated coefficients are visualised in the plot below.

```

# Tweak plot aesthetics with:
#   ↳ https://cran.r-project.org/web/packages/sjPlot/vignettes/custplot.html
# Colour customisation trick from:
#   ↳ https://stackoverflow.com/questions/55598920/different-line-colors-in-forest-plot-output

plot_model(md_interaction,
            #type = "re", # Option to visualise random effects
            show.intercept = TRUE,
            show.values=TRUE,
            show.p=TRUE,
            value.offset = .4,
            value.size = 3.5,
            colors = palette[c(1:3,7:9)],
            group.terms = c(1,5,5,5,5,6,4,2,2,2,2,2,3,3,3,3,3),
            title="Fixed effects",
            wrap.labels = 40,
            axis.title = "PC1 estimated coefficients") +
            theme_sjplot2()

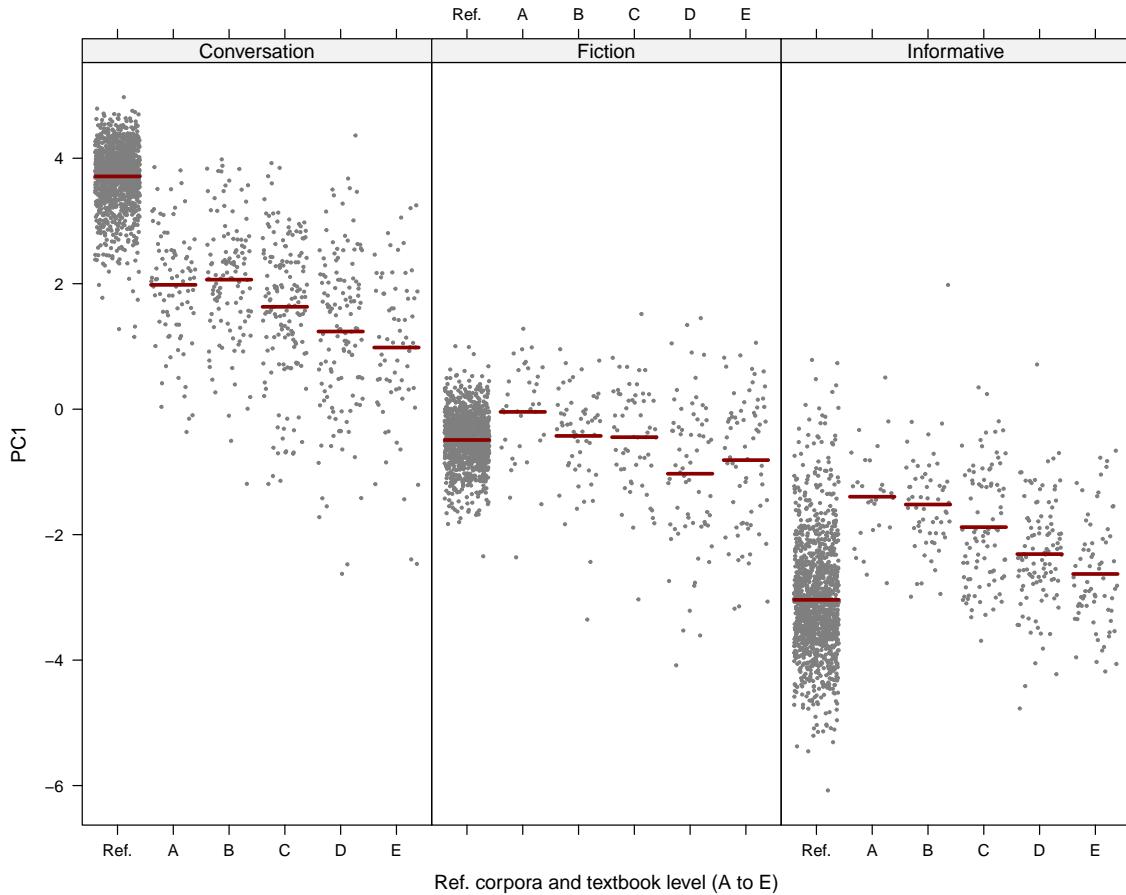

```

```
#ggsave(here("plots", "TxBRef3Reg_PC1_lmer_fixed.svg"), height = 6, width =
    ↳ 9)
```

The `visreg` function is used to visualise the distributions of the modelled Dim1 scores:

```
# svg(here("plots", "TxBRReg3Reg_predicted_PC1_scores_interactions.svg"),
  ↵ height = 8, width = 9)
visreg(md_interaction, xvar = "Level", by="Register",
       #type = "contrast",
       type = "conditional",
       line=list(col="darkred"),
       points=list(cex=0.3),
       xlab = "Ref. corpora and textbook level (A to E)", ylab = "PC1",
       layout=c(3,1)
)
```

```
# dev.off()
```

For PC2 to PC4, the models with random intercepts and slopes failed to converge, which is why only slopes are included in the following models.

```
# Function to avoid repeating model fitting and comparison process for each
# PC.
run_anova <- function(response_var, data) {
  # Fit the initial model
  md_source <- lmer(formula = paste(response_var, " ~ 1 + (1|Source)"), data =
  data, REML = FALSE)

  # Update models
  md_corpus <- update(md_source, . ~ . + Level)
  md_register <- update(md_source, . ~ . + Register)
  md_both <- update(md_corpus, . ~ . + Register)
  md_interaction <- update(md_both, . ~ . + Level:Register)

  # Perform ANOVA
  anova_results <- anova(md_source, md_corpus, md_register, md_both,
  md_interaction)

  # Print ANOVA results
  print(anova_results)

  # Save model object with appropriate name
  pc_number <- gsub("PC", "", response_var)
  assign(paste("md_interaction_PC", pc_number, sep = ""), md_interaction,
  envir = .GlobalEnv)

  # Return tabulated model
  return(md_interaction)
}
```

H.10.3 Dimension 2: 'Narrative vs. Non-narrative'

We first compare various models and then present a tabular summary of the best-fitting one.

```
PC2_models <- run_anova("PC2", res.ind)
```

```

```

H.10.6 Testing model assumptions

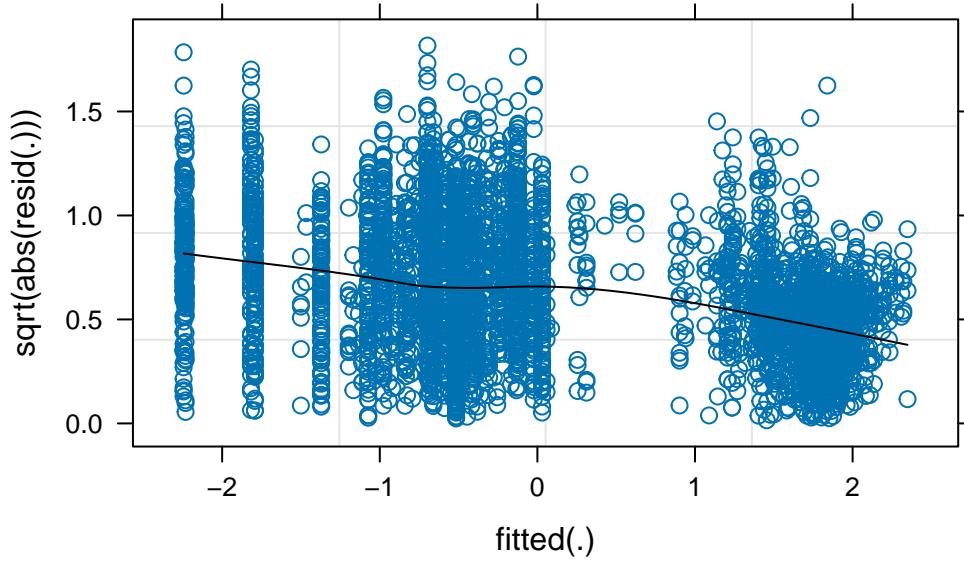

This chunk can be used to check the assumptions of all of the models computed above. In the following example, we examine the final model selected to predict Dim2 scores.

```
model2test <- md_interaction_PC2

# check distribution of residuals
plot(model2test)
```

```
# scale-location plot
plot(model2test,
      sqrt(abs(resid(.)))~fitted(.),
      type=c("p","smooth"), col.line=1)
```

```
# Q-Q plot
lattice::qqmath(model2test)
```
